PREFACE

Results of the 2008-2009 performance tests of small grains grown for grain and forage are printed in this research report. Grain-evaluation studies were conducted at five locations in Georgia, including Tifton, Plains, and Midville in the coastal plain region, Griffin in the piedmont region, Calhoun in the limestone valley region, and at Marianna, Fla. Small grain forage evaluation tests were conducted at four locations in Georgia, which included Tifton and Plains in the coastal plain, Griffin in the piedmont, and Calhoun in the limestone valley region, and at Marianna, Fla. For identification of the test locations, consult the map inside the back cover of this report.

Grain yields are reported as bushels per acre at 13.5% moisture for wheat, 13% for triticale and rye, 12.5% moisture for oats, and 12% moisture for barley. Additional agronomic data such as plant height, lodging, disease incidence, etc., are listed along with the corresponding yield data. Information concerning culture and fertilizer practices used is included in footnotes. Due to small grain forage systems in Georgia, clipping of rye plots in the rye forage trials discontinued on or about March 31. Since the average yield from several years indicates a variety's potential better than a single year's data, multiple-year yield summaries are included.

In order to have a broad base of information, a number of varieties, including experimental lines, are included in the tests, but this does not imply that all are recommended for Georgia. Varieties best suited to a specific area or for a particular purpose and agreed upon by College of Agricultural and Environmental Sciences scientists are presented on pages 4 and 5 and also in the 2008 Fall Planting Schedule for Georgia (available at your county University of Georgia Cooperative Extension office). For additional information, contact your local county extension agent or the nearest UGA campus, research and education center, or extension center.

The least significant difference (LSD) at the 10% level has been included in the tables to aid in comparing varieties and tests. If the yields' difference of any two varieties exceeds the LSD value, they can be considered different in yield ability. **Bolding** is used in the performance tables to indicate entries with yields statistically equal to the highest yielding entry in the test. The standard error (Std. Err.) of an entry mean is included at the bottom of each table to provide a general indicator of the level of precision of each variety experiment. The lower the value for the standard error of the entry mean, the more precise the experiment.

This report is one of five publications presenting the performance of agronomic crops in Georgia. For information concerning other crops, refer to one of the following research reports: 2008 Corn Performance Tests (Report 717), 2008 Soybean, Sorghum Grain and Silage, Summer Annual Forages, and Sunflower Performance Tests (Report 718), 2008 Peanut, Cotton and Tobacco Performance Tests (Report 719), and 2007-2008 Canola Performance Tests (Report 716).

This report, along with performance test information on other crops, is also available at our website www.swvt.uga.edu. Additional information may be obtained by writing to Mr. J. LaDon Day, Department of Crop and Soil Sciences, Griffin Campus, 1109 Experiment Street, Griffin, GA 30223-1797.

Sources of Seed for the 2008-2009 Small Grains Performance Tests.....

82

2008-2009 SMALL GRAIN PERFORMANCE TESTS

*Edited by J. LaDon Day, Anton E. Coy,
and John D. Gassett*

The Season

One of the worst droughts in the state's history continued into small grain planting season in the fall 2008. For the third consecutive season, topsoil moisture over much of the state was short - very short in several areas. Consequently, planting of the 2008-2009 small grain crop was delayed for most farmers. Georgia wheat producers seeded 370 thousand acres of wheat during the 2008-2009 crop year, a decrease of 110,000 acres or 30% less than the previous year. Rye producers seeded 170,000 acres, 15% less than last year, while oat acreage increased 7% totaling 70,000 acres.

Rainfall amounts recorded monthly at the five test locations in Georgia and at Marianna, Fla., during the 2008-2009 growing season are presented in the following table. Due to above-normal rainfall during late winter and spring (the second wettest spring on record in Georgia), on June 10, 2009, water restrictions were cancelled across the state for the first time in three years. Seasonal total rainfall at variety research locations was above normal for the first time in many years, except at Griffin and Midville, where 1.84" and .22" less than normal rainfall occurred, respectively.

2008-2009 Rainfall¹

Month	Year	Calhoun ²	Griffin	Midville	Plains	Tifton	Marianna, FL ³
----- inches -----							
October	2008	3.04	4.83	2.10	3.88	6.41	5.12
November	2008	2.46	3.12	3.78	4.08	3.88	3.19
December	2008	7.66	2.89	3.15	6.81	3.11	8.22
January	2009	7.26	3.00	0.91	2.24	1.64	2.33
February	2009	5.09	4.10	1.52	3.41	2.17	3.26
March	2009	5.90	8.77	3.27	7.67	8.23	7.11
April	2009	4.45	3.99	5.84	5.09	8.26	7.73
May	2009	8.78	3.69	9.35	7.09	6.54	9.15
June	2009	2.47	1.73	1.99	2.71	1.98	2.78
Total (9 months)		47.11	36.12	31.91	42.98	42.22	48.89
Normal (9 months)		42.15	37.96	32.13	36.21	33.45	38.70

1. Data for Georgia sites collected by Dr. G. Hoogenboom, Griffin Campus, Griffin, GA.

2. Floyd County location.

3. University of Florida North Florida Research and Education Center location.

The 2008-2009 small grain-growing season in Georgia began with very dry soil conditions but, differing from the past several years, ended with above-normal rainfall in most areas. A wet cool spring in north Georgia was beneficial for small grain production, but frosty conditions in early April caused some damage on early varieties.

However, a lack of vernalization was a problem in south Georgia especially for late-maturing varieties. Sporadic insect damage occurred around the state due to Hessian fly and other insects. Powdery mildew was a concern for some farmers due to the moist growing conditions. Seed head sprouting was a problem in the southern part of the state due to persistent heavy rain at harvest time.

Wheat yield for the 2009 Georgia crop was 43 bushels per acre, down 24% from last year's record bushels per acre. There was a total of 270,000 acres of wheat grain harvested, 130,000 acres or 22% less than 2008. This year's total production of 11.6 million bushels for the state was only 48% as much as last year. Thirty thousand acres of oats were harvested in 2009, which is an increase of 20% and is equivalent to the harvested acres of 2007. Twenty-five thousand acres of rye were harvested for grain, a reduction of 38% from the year 2008. Rye production in Georgia is primarily for forage.

SMALL GRAIN CULTURAL PRACTICES

**R. Dewey Lee
Extension Agronomist, Tifton, Georgia**

Fertilization

Soil samples should be taken from all fields to be planted in small grains, whether for grain or grazing. Soil testing prior to planting aids in determining the amount and type of fertilizer needed to produce a small grain crop. This practice may prevent excessive expenditures where the soil fertility level is very high, and it ensures that the nutritional needs of the crop are met.

Lime should be applied to maintain the soil pH at a target pH of 6.0. If the small grains are to be grazed or if magnesium (Mg) levels are low, dolomitic lime (high Mg) should be used. Adequate amounts of lime should be applied to the previous crop to assure that the soil pH is in the desired range prior to planting small grains. However, if soils tests indicate the need for lime, it should be applied as soon as possible in order to allow adequate time for the soil pH change to occur (usually two to three months or more, depending on fineness of grind).

The table below shows the recommended rates of fertilizer N-P₂O₅-K₂O to apply to small grain, based on soil test levels:

Soil Test Rating for Potassium (K₂O)				
	Low	Medium	High	Very High
Low	*-80-80	*-80-40	*-80-0	*-80-0
Medium	*-40-80	*-40-40	*-40-0	*-40-0
High	*-0-80	*-0-40	*-0-0	*-0-0
Very High	*-0-80	*-0-40	*-0-0	*-0-0

*For small grain following a legume, apply 60-80 lb N/acre; for small grain following cotton, corn, etc., apply 80-100 lb N/acre; for small grain following grain sorghum, apply 100-120 lb N/acre. Apply 20-40 lb of recommended N/acre in the fall and the remainder in February. For grazing, increase the total N fertilizer rate by 60 lb N/acre, and apply in two applications — one-half in the fall and the remainder in midwinter.

Planting

Small grain seed should be planted in a well-prepared, firm, moist seedbed. Moldboard plowing or chisel plowing is recommended in preference to disc harrowing. The seed should be planted 1 to 1.5 inches deep. The proper planting date for small grain is important for both grain and forage production. Some factors to consider in determining the date for planting small grains include variety, geographic location, weather patterns, soil moisture, and intended use of the crop. If irrigation is available, the planting date can be more flexible. The following table shows recommended planting dates in Georgia:

Recommended Planting Dates

Crop	Coastal Plain		Piedmont		Limestone Valley	
	Grain	Grazing	Grain	Grazing	Grain	Grazing
Wheat	11/07*- 12/01	10/15	10/25 - 11/15	10/01	10/10 - 11/01	9/15
Oat	11/07 - 12/01	10/01	10/07 - 10/30	9/15	9/25 - 10/15	9/01
Barley	11/07 - 12/01	10/15	10/25 - 11/15	10/01	10/01 - 11/01	9/01
Triticale	11/15 - 12/15	-	-	-	-	-
Rye	11/07 - 12/01	10/15	10/07 - 11/15	10/01	10/01 - 10/20	9/01

*November 7 in the Upper Coastal Plain and November 15 in the Lower Coastal Plain.

Pest Control

Check with your county extension agent for the latest information on weed, disease, and insect control in small grains.

Varieties

Select high-yielding, insect- and disease-resistant varieties for best results. In selecting varieties, give careful consideration to the statistics (LSD) reported in the tables. An explanation of their proper use is given in the preface to this report. The variety listed at the top of the list may be only one of many of the best.

For late planting, the early-maturing varieties usually perform the best. Varieties recommended for the 2009 planting season are presented in the following tables.

Recommended Grain Varieties for 2009

Barley	Nomini (S)	Price (S)	Thoroughbred (S)
Oat	Horizon 201 (S) Horizon 270 (S) Horizon 321 (S)	Horizon 474 (C, P) Plot Spike LA9339 (S) RAM LA99016 (C)	SS76-40 (P,M) TAMO 406 (C)
Wheat	AGS 2010 (C) AGS 2020 (S) ⁴ AGS 2026 (S) AGS 2031 (S) ⁴ AGS 2035 (C) AGS 2060 (S) ³	Coker 9553 (P,M) ^{2,4} Dominion (P,M) ⁴ Dyna-Gro Baldwin (C) Fleming (C) ³ Jamestown (C) Magnolia (P,M)	Oglethorpe (S) Pioneer 26R61 (S) SS 8308 (P,M) SS 8641 (S) USG 3209 (S) ⁴ USG 3295 (S) ⁴ USG 3592 (P,M) ²
Triticale	Monarch (C,P)	Trical 342 (C,P)	

1. M = Mountains; P = Piedmont; C = Coastal Plain; UC = Upper Coastal Plain; LC = Lower Coastal Plain; S = Statewide.
2. Consider using a fungicide; highly susceptible to powdery mildew, leaf rust, stripe rust or crown rust.
3. Plant at end of recommended planting period or later.
4. Susceptible to some Hessian fly; consider using an insecticide.

Recommended Forage Varieties for 2009

Oat	Horizon 201 (S) Horizon 270 (S) Horizon 321 (S)	Horizon 474 (S) RAM LA99016 (S)	SS76-40 (C) TAMO 406 (S)

Triticale	Trical 2700 (C,P) silage only		

1. M = Mountains; P = Piedmont; C = Coastal Plain; UC = Upper Coastal Plain; LC = Lower Coastal Plain; S = Statewide.

Plant certified, treated seed to ensure good germination, the absence of noxious weeds, and varietal purity. General seeding rate recommendations based on bushels per acre are provided in Table 1. Seed size varies greatly from year to year and among varieties and seed lots. Therefore, more accurate plant populations may be achieved by using seeding rates based on seeds per area rather than on bushels per acre. For example, research on wheat has shown that seeding rates of 30-35 seeds per square foot are best for top yields. Accurate target populations are best achieved by adjusting grain drill settings based on number of seed per foot of row. Grain drill calibrations can be accomplished quickly and accurately by counting seed collected from one or more rows during travel over a specified distance and calculating the drill output as seeds per foot of row. Table 2 is provided as a guide to establish target populations of the small grain crops for popular row spacings. The figures in Table 2 are broadly based on the average number of seeds per pound for the various crops, but even more accurate calibrations can be accomplished if the actual number of seeds per pound is known for the seed lot being planted. At least one seed supplier in the Southeast now prints seed size information on the bag. If seed size is known, Table 3 may more accurately predict seed requirements.

Table 1. Recommended Seeding Rates for 2009

Crop	Weight lb/bu	Grain	Grazing
		----- bu/acre -----	
Wheat	60	1.75-2.5	2.0-2.5
Oat	32	2.0	4.0
Barley	48	2.0-2.5	----
Rye	56	1.0-1.5	2.0-2.5
Triticale	48	1.5-2.0	2.0-2.5

Table 2. Example of seeding rate of different small grains.

Crop	Seeding Rate			Row Width (inches)			
	seeds/sq.ft.	lb/A ¹	bu/A ¹	6	7	8	10
	----- seed per foot of row -----						
Barley	19	72	1.5	10	11	13	16
	25	96	2.0	13	15	17	21
	32	120	2.5	16	19	21	27
Oat	19	64	2.0	10	11	13	16
	24	80	2.5	12	14	16	20
	28	96	3.0	14	16	19	23
	38	128	4.0	19	22	25	32
Wheat	27	90	1.5	14	16	18	23
	37	120	2.0	18	22	25	31

SMALL GRAIN UPDATES

VARIETY RELEASES

**Jerry W. Johnson,
Department of Crop and Soil Sciences,
Griffin Campus, Griffin, GA 30223**

AGS 2035 is a medium maturing, white chaffed, medium height line. It was derived from the cross of AGS 2000 and PIO26R61. Its maturity is similar to AGS 2000. It is resistant to current biotypes of Hessian fly in Georgia. It is also resistant to races of leaf rust and stripe rust and moderately resistant to powdery mildew in the southeastern U.S. It is also resistant to soil-borne mosaic virus.

Dyna-Gro Baldwin is a medium-late maturing and medium height line. It was derived from the cross of AGS 2485 and PIO26R61. Dyna-Gro Baldwin matures about four days later than AGS 2000. It is resistant to current biotypes of Hessian fly in Georgia. It is also resistant to races of leaf rust and stripe rust and moderately resistant to powdery mildew in the southeastern U.S. It is also resistant to soil-borne mosaic virus.

Wheat releases by private companies for production in Georgia include Magnolia.

DISEASES

**James W. Buck and John D. Youmans,
Department of Plant Pathology,
Griffin Campus, Griffin, GA 30223-1797**

Powdery mildew was the disease of greatest importance on the wheat crop this year. The early powdery mildew disease pressure was highest in Tifton and southwest Georgia. Mildew pressure was also high at Plains as well. The additional rainfall in the spring kept the powdery mildew active well into late April and early May. Heavy disease pressure early in the season necessitated fungicide applications.

Stripe rust was observed at Plains and Griffin where plots were artificially inoculated. Stripe rust was reported in southwest Georgia and at Tifton, but in general no widespread epidemics were observed in the state. Samples were sent to Washington State to confirm the race of *Puccinia striiformis* involved.

Low infection rates of barley yellow dwarf virus were observed across the state, with higher infection levels noted at Tifton and Plains. Calhoun had the lowest incidence of BYDV.

Stagonospora leaf and glume blotch were at moderate levels across the state again due to the moist early spring conditions observed.

Moderate leaf rust was observed at all locations, and susceptible varieties were hit hard at Tifton and Plains. Rust pressure was somewhat reduced late in the season as drier conditions prevailed.

Overall yields and grain quality were lower than last year due to the excessive rain received at harvest. Sprouting was observed in harvested wheat at Plains and Tifton. Growers will need to be careful in seed selection for fall planting due to lower germination of wheat harvested this year.

INSECTS

**G. David Buntin,
Department of Entomology,
Griffin, Georgia**

The variety test was planted in the fall of 2008 at the Southwest Branch Experiment Station near Plains and was sampled for Hessian fly, *Mayetiola destructor*, infestations in mid-February 2009. Wheat entries also were evaluated in late April at the Bledsoe Research Farm near Griffin and at the Lang Farm near Tifton. Results are shown in the next table. Several wheat varieties showed good levels of Hessian fly resistance at Plains including AGS 2000 (fair), AGS 2010, AGS 2026, AGS 2060, Dyna-Gro Baldwin, Jamestown, Pioneer 26R38 and 26R61, NK-Coker 9152, USG 3592, SS 8308 (fair), 8641, Oglethorpe, and a number of experimental lines. Varieties with good resistance in southern Georgia may not be resistant in northern Georgia because of the presence of biotype L in northern Georgia. The only currently available varieties with biotype L resistance are AGS 2010, AGS 2026, and Oglethorpe. Rye and oats also are good Hessian-fly resistant alternatives to wheat for forage production, because rye is highly resistant and oats are immune to the insect.

Moderate to severe Hessian fly damage was observed in some fields planted with susceptible varieties and in fields with reduced tillage and continuous wheat.

Warm weather encouraged aphid populations in the fall months throughout the state. Aphids caused direct injury to wheat and also transmitted barley yellow dwarf virus (BYDV). BYD infection was variable but generally was not severe throughout most of the state. Although the level of expression of symptoms varies between varieties, no varieties are truly resistant or tolerant of BYDV infection. Systemic insecticide seed treatments and properly timed foliar applications of insecticides can reduce aphid numbers and minimize BYD incidence.

Consult your local county extension agent and the 2009 Georgia Pest Management Handbook for a list of recommended insecticides and for management practices for these and other insect pests of small grains.

1. Yields calculated as 60 pounds per bushel at 13.5% moisture.

2. Whole plant rating: 0 = resistant to 9 = very susceptible, TR = trace.

3. C.V. = 10.7%, and df for EMS = 165.

Bolding indicates entries yielding equal to highest yielding entry within a column based on Fisher's protected LSD (P = 0.10).

Planted: November 20, 2008.

Harvested: June 3, 2009.

Seeding Rate: 22 seeds per foot in 7" rows.

Soil Type: Dothan loamy sand.

Soil Test: P = Medium, K = Medium, and pH = 6.1.

Fertilization: Preplant: 60 lb N, 60 lb P₂O₅, and 60 lb K₂O/acre.

Topdress: 40 lb N/acre.

Management: Paratilled and rototilled; Harmony Extra used for weed control.

Previous Crop: Summer fallow.

Test conducted by A. E. Coy, R. Brooke, and D. Dunn.

LSD at 10% Level	5.1	N.S. ³		5.5	1.0	2	10	-	04
Std. Err. of Entry Mean	3.7	2.5		2.3	0.4	1	4	-	02

1. Yields calculated as 60 pounds per bushel at 13.5% moisture.
2. C.V. = 8.1%, and df for EMS = 45.
3. The F-test indicated no statistical difference at the alpha = 0.10 probability level; therefore, a LSD value was not calculated.

Bolding indicates entries yielding equal to highest yielding entry within a column based on Fisher's protected LSD (P = 0.10).

Planted: December 19, 2008.
 Harvested: June 4, 2009.
 Seeding Rate: 22 seeds per foot in 7" rows.
 Soil Type: Dothan loamy sand.
 Soil Test: P = Medium, K = Medium, and pH = 6.1.
 Fertilization: Preplant: 60 lb N, 60 lb P₂O₅, and 60 lb K₂O/acre.
 Topdress: 40 lb N/acre.
 Management: Paratilled and rototilled; Harmony Extra used for weed control.
 Previous Crop: Summer fallow.

Test conducted by A. E. Coy, R. Brooke, and D. Dunn.

1. Yields calculated as 60 pounds per bushel at 13.5% moisture.

2. C.V. = 8.3%, and df for EMS = 45.

3. The F-test indicated no statistical difference at the alpha = 0.10 probability level; therefore, a LSD value was not calculated.

Bolding indicates entries yielding equal to highest yielding entry within a column based on Fisher's protected LSD (P = 0.10).

Planted: January 9, 2009.

Harvested: June 8, 2009.

Seeding Rate: 22 seeds per foot in 7" rows.

Soil Type: Greenville sandy loam.

Soil Test: P = Low, K = Medium, and pH = 6.1.

Fertilization: Preplant: 15 lb N, 66 lb P₂O₅, and 18 lb K₂O/acre.

Topdress: 80 lb N/acre.

Management: Subsoiled and rototilled.

Previous Crop: Peanut.

Test conducted by A. E. Coy, R. Brooke, D. Dunn, and R. Pines.

1. Yields calculated as 60 pounds per bushel at 13.5% moisture.
2. Three-year data not computed due to cold damaged 2007 wheat crop.
3. 2008 and 2009 data used to compute 2-year average.
4. Percentage Barley Yellow Dwarf disease, whole plant.
5. Whole plant rating: 0 = resistant to 9 = very susceptible, TR = trace.
6. C.V. = 10.6%, and df for EMS = 183.
7. The F-test indicated no statistical difference at the alpha = 0.1 probability level; therefore, an LSD value was not calculated.

Bolding indicates entries yielding equal to highest yielding entry within a column based on Fisher's protected LSD ($P = 0.10$).

- Planted: October 29, 2008.
 Harvested: June 3, 2009.
 Seeding Rate: 22 seeds per foot in 7" rows.
 Soil Type: Appling sandy loam.
 Soil Test: P = Low, K = High, and pH = 5.7.
 Fertilization: Preplant: 20 lb N, 40 lb P₂O₅, and 60 lb K₂O/acre.
 Topdress: 70 lb N/acre.
 Management: Chisel plowed, disked and rototilled.
 Previous Crop: Soybeans.

Test conducted by J. Gassett and G. Ware.

1. Yields calculated at 60 pounds per bushel at 13.5% moisture.

2. Tifton, Plains, and Midville.

3. Griffin and Calhoun.

4. 2007, 2008 and 2009 used for 3-year average.

5. 2008 and 2009 used for 2-year average.

6. Three-year average not computed due to 2007 cold damaged crop.

7. 2008 and 2009 used for 2-year average.

8. Statewide three-year average not computed due to 2007 cold damaged crop in north Georgia.

Bolding indicates entries yielding equal to highest yielding entry within a column based on Fisher's protected LSD (P = 0.10).

1. Yields calculated as 32 pounds per bushel at 12.5% moisture.

2. C.V. = 13.7%, and df for EMS = 63.

3. The F-test indicated no statistical difference at the alpha = 0.10 probability level; therefore, a LSD value was not calculated.

Bolding indicates entries yielding equal to highest yielding entry within a column based on Fisher's protected LSD (P = 0.10).

Planted: November 20, 2008.

Harvested: June 2, 2009.

Seeding Rate: 11 seeds per foot in 7" rows.

Soil Type: Dothan loamy sand.

Soil Test: P = Medium, K = Medium, and pH = 6.1.

Fertilization: Preplant: 60 lb N, 60 lb P₂O₅, and 60 lb K₂O/acre.

Topdress: 40 lb N/acre.

Management: Paratilled and rototilled; Harmony Extra used for weed control.

Previous Crop: Summer fallow.

Test conducted by A. E. Coy, R. Brooke, and D. Dunn.

Average	83.2	87.9		92.8 ²	32.3	49	46	100	04/25
LSD at 10% Level	N.S. ³	N.S.		18.8	1.0	4	38	-	03
Std. Err. of Entry Mean	3.7	5.2		8.0	0.4	2	16	-	01

1. Yields calculated as 32 pounds per bushel at 12.5% moisture.

2. C.V. = 17.1%, and df for EMS = 63.

3. The F-test indicated no statistical difference at the alpha = 0.10 probability level; therefore, a LSD value was not calculated.

Bolding indicates entries yielding equal to highest yielding entry within a column based on Fisher's protected LSD (P = 0.10).

Planted: October 22, 2008.

Harvested: June 15, 2009.

Seeding Rate: 11 seeds per foot in 7" rows.

Soil Type: Wax loam.

Soil Test: P = High, K = Very High, and pH = 6.0.

Fertilization: Preplant: 50 lb N, 50 lb P₂O₅, and 75 lb K₂O/acre.

Topdress: 70 lb N/acre.

Management: Chisel plowed, disked and rototilled.

Previous Crop: Soybeans.

Test conducted by J. Gassett, G. Ware, and J. Stubbs.

1. C.V. = 10.6%, and df for EMS = 27.
2. The F-test indicated no statistical difference at the alpha = 0.10 probability level; therefore a LSD value was not calculated.

Bolding indicates entries yielding equal to highest yielding entry within a column based on Fisher's protected LSD (P = 0.10).

Planted: October 16, 2008.
 Seeding Rate: 27 seed/foot in 7" rows.
 Soil Type: Cecil sandy loam.
 Soil Test: P = High, K = Very High, and pH = 6.2.
 Fertilization: Preplant: 35 lb N, 70 lb P₂O₅, and 105 lb K₂O/acre.
 Topdress: 50 lb N/acre after 1st and 2nd harvests.
 Management: Chisel plowed, disked and rototilled.
 Previous Crop: Fallow.

Test conducted by J. Gassett and G. Ware.

1. C.V. = 9.3%, and df for EMS = 54.

Bolding indicates entries yielding equal to highest yielding entry within a column based on Fisher's protected LSD ($P = 0.10$).

Planted: October 21, 2008.

Seeding Rate: 22 seed/foot in 7" rows.

Soil Type: Chipola loamy sand.

Soil Test: P = Medium, K = Medium, and pH = 6.4.

Fertilization: Preplant: 20 lb N, 40 lb P_2O_5 , and 60 lb K_2O /acre.

Topdress: 51 lb N and 30 lb K-Mag/acre on December 15, 2008; 51 lb N/acre after 1st and 2nd harvests; and 51 lb N and 30 lb K-Mag/acre after 3rd harvest.

Management: Moldboard plowed and rototilled: Buctril and Harmony Extra used for weed control.

Previous Crop: Corn.

Test conducted by J. Jones.

1. C.V. = 5.9%, and df for EMS = 81.

2. The F-test indicated no statistical difference at the alpha = 0.10 probability level; therefore a LSD value was not calculated.

Bolding indicates entries yielding equal to highest yielding entry within a column based on Fisher's protected LSD (P = 0.10).

- Planted: October 23, 2008.
 Seeding Rate: 50 lb/acre in 7" rows.
 Soil Type: Greenville sandy clay loam.
 Soil Test: P = Low, K = High, and pH = 6.1.
 Fertilization: Preplant: 56 lb N, 88 lb P₂O₅, and 24 lb K₂O/acre.
 Topdress: 50 lb N/acre after 1st, 2nd, and 3rd harvests.
 Management: Subsoiled and rototilled.
 Previous Crop: Peanut.

Test conducted by A. E. Coy, R. Brooke and D. Dunn.

The University of Georgia and Ft. Valley State University, the U.S. Department of Agriculture and counties of the state cooperating. Cooperative Extension, the University of Georgia College of Agricultural and Environmental Sciences, offers educational programs, assistance and materials to all people without regard to race, color, national origin, age, gender or disability.

An Equal Opportunity Employer/Affirmative Action Organization Committed to a Diverse Work Force

“CERTIFIED SEED DOESN’T COST ... IT PAYS”

HERE’S WHY:

- ◊ Known performance of varieties adapted to your area.
- ◊ A pedigree record that begins with the release of Breeder seed and continues until it reaches the consumer as Certified (blue tag) seed.
- ◊ Field inspected for trueness to variety and inseparable other crop and weed seed.
- ◊ Can only be conditioned in an approved facility.
- ◊ Must meet high quality standards as to germination and purity.
- ◊ Free of noxious weeds.

The planting of CERTIFIED SEED eliminates many of the risks associated with crop production. For sources of Certified seed, contact your local county extension agent or the Georgia Crop Improvement Association, Inc. (706-542-2351).
