## PREFACE

Results of the 2015-2016 performance tests of small grains grown for grain and forage are printed in this research report. Grain evaluation studies were conducted at five locations in Georgia, including Tifton, Plains, and Midville in the Coastal Plain region; Griffin in the Piedmont region; and Calhoun in the Limestone Valley region. Small grain forage evaluation tests were conducted at four locations in Georgia/Florida, including Tifton and Plains in the Coastal Plain region, Griffin in the Piedmont region, Calhoun in the Limestone Valley region, and at Marianna, Florida. For identification of the test locations, consult the map inside the back cover of this report.

Grain yields are reported as bushels per acre at 13.5% moisture for wheat, 13% moisture for triticale and rye, 12.5% moisture for oats, and 12% moisture for barley. Additional agronomic data, such as plant height, lodging, and disease incidence, are listed along with the corresponding yield data. Footnotes include information concerning fertilization and cultural practices used in the tests. Since the average yield from several years indicates a variety's potential better than a single year's data, multiple year yield summaries are included.

In order to have a broad base of information, a number of varieties, including experimental lines, are included in the tests, but this does not imply that all are recommended for Georgia. Varieties best suited to a specific area or for a particular purpose and agreed upon by College of Agricultural and Environmental Sciences scientists are presented on pages 4 and 5 and also in the 2016 Fall Planting Schedule for Georgia (available at your county Extension office). For additional information, contact your local county Extension office, the nearest UGA campus, or the nearest UGA Research and Education Center.

The Least Significant Difference (LSD) at the 10 percent level has been included in the tables to aid in comparing varieties and tests. If the yields' difference of any two varieties exceeds the LSD value, they can be considered different in yield ability. **Bolding** is used in the performance tables to indicate entries with yields statistically equal to the highest yielding entry in the test. The standard error (Std. Err.) of an entry mean is included at the bottom of each table to provide a general indicator of the level of precision of each variety experiment. The lower the value for the standard error of the entry mean, the more precise the experiment.

This report is one of five publications presenting the performance of agronomic crops in Georgia. For information concerning other crops, refer to one of the following research reports: 2015 Corn Performance Tests (Annual Publication 101-7); 2015 Soybean, Sorghum Grain and Silage, and Summer Annual Forages Performance Tests (Annual Publication 103-7); 2015 Peanut, Cotton, and Tobacco Performance Tests (Annual Publication 104-7); and 2013-2014 Canola Performance Tests (available at <http://www.swvt.uga.edu/canola.html>).

This report, along with performance test information on other crops, is also available online at [www.swvt.uga.edu](http://www.swvt.uga.edu). Additional information may be obtained by writing to Mr. John D. Gassett, Department of Crop and Soil Sciences, Griffin Campus, 1109 Experiment Street, Griffin, GA 30223-1797.

# 2015-2016 SMALL GRAIN PERFORMANCE TESTS

*Edited by John D. Gassett, Dustin G. Dunn,  
Henry Jordan Jr., and J. LaDon Day*

## The Season

For the first time in years, Georgia producers of small grain were faced with adequate moisture for planting, while excessive rainfall delayed planting of small grains for many in the state. Heavy showers either washed out or silted over seed in some fields. Topsoil and subsoil moisture across the state was adequate in the fall of 2015. Delayed seeding due to unfavorable conditions resulted in mid- to late-planted crops. Georgia wheat producers seeded 230 thousand acres of wheat during the 2015-2016 crop year, an increase of 15,000 acres or 7% more than the previous year. Rye producers seeded 160,000 acres, a 24% decrease over last year, and oat seeded acres decreased to 50,000 acres, 23% less than last year.

Rainfall amounts recorded monthly at the six test locations in Georgia and at Marianna, FL during the 2015-2016 nine-month growing season are presented in the following table. All six locations received above average rainfall between October 2015 and June 2016.

**2015-2016 Rainfall<sup>1</sup>**

Month	Year	Calhoun <sup>2</sup>	Griffin	Midville	Plains	Tifton	Marianna, FL <sup>3</sup>
----- inches -----							
October	2015	5.86	2.25	2.58	1.37	1.55	1.00
November	2015	6.81	9.51	5.00	6.68	4.68	7.33
December	2015	12.47	14.72	7.00	13.89	6.48	8.68
January	2016	3.69	3.88	1.82	3.39	3.08	4.79
February	2016	6.42	4.23	5.24	3.71	5.51	3.51
March	2016	4.33	3.36	2.83	2.39	5.26	8.16
April	2016	2.38	4.94	4.00	4.57	6.34	4.93
May	2016	1.79	3.61	4.22	0.84	1.45	1.74
June	2016	4.16	1.00	3.94	4.02	3.94	3.49
<b>Total (9 months)</b>		<b>47.91</b>	<b>47.50</b>	<b>36.63</b>	<b>40.86</b>	<b>38.29</b>	<b>43.63</b>
<b>Normal (9 months)</b>		<b>43.14</b>	<b>38.40</b>	<b>32.53</b>	<b>37.18</b>	<b>35.07</b>	<b>38.70</b>

1. Data for Georgia sites collected by Dr. Ian Flitcroft, Griffin Campus, Griffin, Ga.

2. Floyd County location.

3. University of Florida North Florida Research and Education Center location.

The small grain growing season of 2015-2016 was wet for much of Georgia, however, above average temperatures caused a lack of vernalization for some in the state. There was sporadic insect damage around the state due to Hessian fly and cereal leaf beetle, but the damage was small. Powdery mildew was of concern for farmers across Georgia and required an application of fungicide. Also, Fusarium head blight

---

John D. Gassett is the program director of statewide variety testing, Henry Jordan, Jr. is a research professional III, and J. LaDon Day is a research scientist in the Department of Crop and Soil Sciences, Griffin Campus, Griffin, Georgia 30223-1797. Dustin G. Dunn is a research professional III in the Department of Crop and Soil Sciences, Tifton Campus, Tifton, Georgia 31793-5766.

disease caused economic damage for the third year in a row due to the cold, wet weather during anthesis. Crown rust in oats was a concern for oat producers for a fourth year in a row.

During 2016, Georgia wheat producers harvested 135,000 acres of wheat grain, 55,000 acres or 29% less than 2015. This acreage of wheat produced 8.74 million bushels, a 22% decrease from last year. Twenty thousand acres of oats were harvested for grain during 2016, which is a decrease of 5,000 acres under the previous year. Forty thousand acres of rye were harvested for grain, an increase of 33% over the previous year. Rye production in Georgia is primarily for forage and as a cover crop.

# SMALL GRAIN CULTURAL PRACTICES

**R. Dewey Lee**  
**Extension Agronomist, Tifton, Georgia**

## Fertilization

Soil samples should be taken from all fields used for planting in small grains, whether for grain or grazing. Testing the soil before planting helps to determine the amount and type of fertilizer needed to produce a small grain crop. This practice may prevent excessive expenditures where the soil fertility level is very high, and it ensures that the nutritional needs of the crop are met.

Lime should be applied to maintain the soil pH at a target pH of 6.0. If the small grains are to be grazed or if magnesium (Mg) levels are low, dolomitic lime (high Mg) should be used. Adequate amounts of lime should be applied to the previous crop to ensure that the soil pH is in the desired range prior to planting small grains. If soil tests indicate the need for lime, it should be applied as soon as possible in order to allow adequate time for the soil pH change to occur (usually two to three months or more, depending on the fineness of grind).

The table below shows the recommended rates of fertilizer N-P<sub>2</sub>O<sub>5</sub>-K<sub>2</sub>O to apply to small grains, based on soil test levels:

Soil Test Rating for Potassium (K <sub>2</sub> O)				
	Low	Medium	High	Very High
Low	*-80-80	*-80-40	*-80-0	*-80-0
Medium	*-40-80	*-40-40	*-40-0	*-40-0
High	*-0-80	*-0-40	*-0-0	*-0-0
Very High	*-0-80	*-0-40	*-0-0	*-0-0

\*For a small grain following a legume, apply 60-80 lb N/acre; for a small grain following cotton, corn, etc., apply 80-100 lb N/acre; for a small grain following grain sorghum, apply 100-120 lb N/acre. Apply 20-40 lb of recommended N/acre in the fall and the remainder in February. For grazing, increase the total N fertilizer rate by 60 lb N/acre and apply in two applications — one-half in the fall and the remainder in mid-winter.

## Planting

Small grain seed should be planted in a well-prepared, firm, moist seedbed. Moldboard plowing or chisel plowing is recommended over disc harrowing. The seed should be planted 1 to 1.5 inches deep. The proper planting date for small grains is important for both grain and forage production. Some factors to consider in determining the date for planting small grains include variety, geographic location, weather patterns, soil moisture, and intended use of the crop. If irrigation is available, the planting date can be more flexible. The following table shows recommended planting dates in Georgia:

### Recommended Planting Dates

Crop	Coastal Plain		Piedmont		Limestone Valley	
	Grain	Grazing	Grain	Grazing	Grain	Grazing
Wheat	11/07*- 12/01	10/15	10/25 - 11/15	10/01	10/10 - 11/01	9/15
Oat	11/07 - 12/01	10/01	10/07 - 10/30	9/15	9/25 - 10/15	9/01
Barley	11/07 - 12/01	10/15	10/25 - 11/15	10/01	10/01 - 11/01	9/01
Triticale	11/15 - 12/15	-	-	-	-	-
Rye	11/07 - 12/01	10/15	10/07 - 11/15	10/01	10/01 - 10/20	9/01

\*November 7 in the Upper Coastal Plain and November 15 in the Lower Coastal Plain.

### Pest Control

Check with your county Extension agent for the latest information on weed, disease and insect control in small grains, or refer to the most current edition of the *Georgia Pest Management Handbook*.

### Varieties

Select high-yielding, insect- and disease-resistant varieties for best results. Give careful consideration to the statistics (LSD) reported in the tables in this publication. An explanation of their proper use is given in the preface to this report. The variety listed at the top of the list may be only one of the best.

For late planting, the early-maturing varieties usually perform the best. Varieties recommended for the 2016 planting season are presented in the following tables.

### Recommended Grain Varieties for 2016

Barley	Atlantic (S)	Secretariat (S)	Thoroughbred (S)
Oat	FL: 270 (S) <sup>5</sup> Gerard 224 (S) <sup>2</sup> Gerard 229 (P,M) <sup>2</sup>	*Horizon 201 (S) <sup>2</sup> Horizon 270 (S) <sup>2</sup> Horizon 306 (S) <sup>2</sup>	SS 76-50 (P,M) <sup>2</sup>
Wheat	AGS 2024 (S) *AGS 2026 (S) *AGS 2027 (S) AGS 2033 (S) *AGS 2038 (S) *AGS 2060 (C) <sup>2,3</sup> Dyna-Gro 9171 (P,M) <sup>4</sup>	Dyna-Gro Savoy (S) Jamestown (S) <sup>2,4</sup> *LA754 (C) <sup>2</sup> *Oglethorpe (S) Pioneer 26R10 (P,M) Pioneer 26R41 (P,M) <sup>2</sup> Pioneer 26R94 (S)	Southern Harvest 550 (S) SS 8415 (S) SS 8629 (S) *SS 8641 (S) *TV8848 (P,M) <sup>2</sup> *TV8861 (P,M) USG 3024 (P,M)
Triticale	Monarch (C,P)	SS Triticale 1414 (P)	Trical 342 (C,P)

1. M = Mountains; P = Piedmont; C = Coastal Plain; S = Statewide.
  2. Consider using a labeled fungicide; highly susceptible to powdery mildew, leaf rust, stripe rust, or crown rust.
  3. Plant only at end of recommended planting period or later.
  4. Susceptible to some Hessian fly; consider using an insecticide.
  5. Crown rust resistant.
- \* To be dropped from list in 2017.

## Recommended Forage Varieties for 2016

Oat	*Horizon 201 (S) Horizon 306 (S)	Okay (S) NF402 (S)	RAM LA99016 (S) SS 76-50 (S)
Wheat	AGS 2038 (S) Dyna-Gro Savoy (C)	*Oglethorpe (P,M) *Roberts (P,M) <sup>2</sup>	Southern Harvest 550 (S) <sup>3</sup> *SS 8641 (S)
Rye	Bates RS4 (S) Elbon (S)	FL 104 (S) Florida 401 (C) <sup>2</sup>	Oklon (S) Wrens Abruzzi (S)
Triticale	Monarch (C,P)	SS Triticale 1414 (S)	Trical 342 (C,P)
Ryegrass	Attain (S) Big Boss (S) *Diamond T (S) *Earlyploid (S) Flying A Fria (S)	Grazer (P,M) Jackson (P,M) Lonestar (S) Marshall (S) Maximus (S) Nelson (S)	Passerel Plus (S) Prine (S) TAMTBO (S) TetraStar (S) Winterhawk (S)

1. M = Mountains; P = Piedmont; C = Coastal Plain; S = Statewide.

2. Suitable for early planting.

3. Susceptible to some Hessian fly; consider using an insecticide.

\* To be dropped from list in 2017.

To ensure good germination, the absence of noxious weeds, and varietal purity, **plant certified, treated seed**. General seeding rate recommendations based on bushels per acre are provided in Table 1. Seed size varies greatly from year to year and among varieties and seed lots. Therefore, more accurate plant populations may be achieved by using seeding rates based on seeds per area rather than on bushels per acre. For example, research on wheat has shown that seeding rates of 30-35 seeds per square foot are best for top yields. Accurate target populations are best achieved by adjusting grain drill settings based on the number of seed per foot of row. Grain drill calibrations can be accomplished quickly and accurately by counting seed collected from one or more rows during travel over a specified distance and calculating the drill output as seeds per foot of row. Table 2 is provided as a guide to establish target populations of the small grain crops for popular row spacings. The figures in Table 2 are broadly based on the average number of seeds per pound for the various crops but even more accurate calibrations can be accomplished if the actual number of seeds per pound is known for the seed lot being planted. At least one seed supplier in the Southeast now prints seed size information on the bag. If seed size is known, Table 3 may more accurately predict seed requirements.

**Table 1. Recommended seeding rates for 2016.**

Crop	Weight	Grain	
		lb/bu	----- bu/acre -----
Wheat	60	1.75-2.5	2.0-2.5
Oat	32	2.0	4.0
Barley	48	2.0-2.5	----
Rye	56	1.0-1.5	2.0-2.5
Triticale	48	1.5-2.0	2.0-2.5

**Table 2. Example of seeding rates of different small grains.**

Crop	Seeding Rate			Row Width (inches)			
	seeds/sq.ft.	lb/A <sup>1</sup>	bu/A <sup>1</sup>	6	7	8	10
Barley	19	72	1.5	10	11	13	16
	25	96	2.0	13	15	17	21
	32	120	2.5	16	19	21	27
Oat	19	64	2.0	10	11	13	16
	24	80	2.5	12	14	16	20
	28	96	3.0	14	16	19	23
	38	128	4.0	19	22	25	32
Wheat	27	90	1.5	14	16	18	23
	37	120	2.0	18	22	25	31
	47	150	2.5	24	27	31	39
	55	180	3.0	28	32	37	46
Rye	31	56	1.0	16	18	21	26
	46	84	1.5	23	27	31	38
	62	112	2.0	31	36	41	52

1. Estimates based on average seeds per pound of 11,500 for barley, 12,875 for oat, 13,250 for wheat, and 24,000 for rye.

Data compiled by J. L. Day, Griffin Campus, Griffin, Georgia.

**Table 3. Seeding rates for wheat based on seed size<sup>1</sup>.**

Seed Size seeds/lb	Desired Population (seeds per square foot)						
	30	32	34	35	36	38	40
10,000	145	155	165	169	174	184	194

# SMALL GRAIN UPDATES

## DISEASES

**James W. Buck, Alfredo Martinez-Espinoza, and John D. Youmans  
Department of Plant Pathology  
Griffin Campus, Griffin, Georgia**

Georgia again experienced an abnormally wet fall ahead of small grain planting in the Piedmont and Mountain areas. Fall plantings were difficult, with most wheat being planted into very wet soils. Plantings in the Upper Coastal Plain and Coastal Plains were timely, but planted wheat acreage was greatly reduced across the state. Rain in November and December led to saturated soils well into late winter.

Soilborne mosaic virus (SBMV) was observed only at Plains, but due to the warmer winter, the disease was not widespread in the state. The soilborne complex of diseases needs wet or moist soils and cool soil temperatures for disease development.

Barley yellow dwarf virus (BYDV) was observed at high levels across the state. Oats were especially hit hard. Warmer fall and winter temperatures allowed aphid populations to develop in large numbers and vector the virus into the small grain crops. In an El Nino year such as we have experienced, fall or early winter spraying for aphid control may be necessary for grain production especially with oats. Imidacloprid seed dressings for wheat are also effective in controlling early season infections.

Fusarium head blight (FHB/Scab) (*Fusarium graminearum*) incidences were widespread across the state. FHB was observed at high levels at Tifton and Plains. State wheat trials at both locations were scored with high infection rates. This is the third year in a row of extremely high infection rates within the state. Increased corn production may be providing the fungal inoculum necessary to keep FHB an ongoing problem in Georgia. Planting FHB resistant cultivars as well as judicious spraying and crop rotation are all important elements for disease management. Please refer to UGA Extension Publication C1066, *Identification and Control of Fusarium Head Blight (Scab) of Wheat in Georgia* for additional information about dealing with scab.

Powdery mildew (*Blumeria graminis*) was observed in the state at low levels and may be a result of fewer planted acres along with a very wet winter and spring. Mildew is favored by cooler and damp, not wet, conditions.

Leaf rust (*Puccinia triticina*) was observed at all research locations in the state. Disease levels were low in most cases, and cooler nights into the spring may have kept rust at lower levels. Leaf rust levels did increase at Plains and Tifton later in the season.

Stripe rust (*Puccinia striiformis*) was observed at Plains where plots were artificially inoculated. Stripe rust was not found in other locations around the state and was not a problem for growers this season.

Crown rust (*Puccinia coronata*) in oats was observed at devastatingly high levels, particularly at Plains and Tifton. The state trials at these two locations had only two or three resistant varieties in the entire test. Breeding for resistant varieties is the strategy in play at the current time. There are labeled foliar fungicides available for application on oats. Producers may want to consider using them until newer resistant varieties are developed.

Stagonospora spot blotch and tan spot were observed in wheat throughout the state at low levels. Tan spot was also reported on rye in the state.

## INSECTS

**G. David Buntin**  
**Department of Entomology**  
**Griffin Campus, Griffin, Georgia**

The variety tests were sampled for Hessian fly, *Mayetiola destructor*, in late April, 2016 at Southwest Branch Research and Education Center near Plains and at the Bledsoe Research farm near Griffin. Results are from a sample of 20 stems at each location and are shown in the next table.

Hessian fly infestations were moderate at both locations, making definitive ratings difficult. Several wheat varieties showed good levels of Hessian fly resistance. Varieties with good resistance in southern Georgia may not be resistant in northern Georgia because of the presence of biotype L in northern Georgia. Rye and oats also are good Hessian-fly resistant alternatives to wheat for forage production, because rye is highly resistant, and oats are immune to the insect.

Wet conditions in the fall of 2015-2016 delayed planting of wheat in some areas. Hessian fly infestations were low in the fall but reached high levels by the time of the spring generation in susceptible varieties in some areas. Aphids caused direct injury to wheat and also transmitted barley yellow dwarf virus (BYDV). Aphid infestations were generally variable and sometimes significant throughout the state. However, BYD infection was generally low in the Coastal Plain region but moderate to high in northern Georgia. Systemic insecticide seed treatments and properly timed foliar applications of insecticides can reduce aphid numbers and minimize BYD incidence. Cereal leaf beetle infestations also caused leaf defoliation in some fields mostly in central and eastern Georgia. Consult your local county Extension agent and the commercial edition of the 2016 Georgia Pest Management Handbook for a list of recommended insecticides and for management practices for these and other insect pests of small grains.

## Tifton, Georgia: Wheat Grain Performance, 2015-2016 (Continued)

---

1. Yields calculated as 60 pounds per bushel at 13.5% moisture.
2. Powdery mildew rating 1 - 10; data collected on March 30, 2016.
3. Leaf rust data collected on May 4, 2016.
4. Fusarium head blight (FHB/Scab) rating 1 - 10; data collected on May 4, 2016.
5. C.V. = 8.4%, and df for EMS = 210.

**Bolding** indicates entries yielding equal to highest yielding entry within a column based on Fisher's protected LSD (P = 0.10).

Planted: November 23, 2015.

Harvested: June 1, 2016.

Seeding Rate: 22 seeds per foot in 7" rows.

Soil Type: Dothan loamy sand.

Soil Test: P = Low, K = Low, and pH = 6.0.

Fertilization: Preplant: 40 lb N, 100 lb P<sub>2</sub>O<sub>5</sub>, and 110 lb K<sub>2</sub>O/acre.

Topdress: 100 lb N/acre.

Management: Disked, moldboard plowed, and rototilled; Harmony Extra used for weed control;  
1000 lb lime/acre.

Previous Crop: Soybeans.

Test conducted by D. Dunn, R. Brooke, B. McCranie, and G. South.

1. Yields calculated as 60 pounds per bushel at 13.5% moisture.

2. C.V. = 7.8%, and df for EMS = 24.

3. The F-test indicated no statistical difference at the alpha = 0.10 probability level; therefore, an LSD value was not calculated.

**Bolding** indicates entries yielding equal to highest yielding entry within a column based on Fisher's protected LSD (P = 0.10).

Planted: December 10, 2015.

Harvested: May 25, 2016.

Seeding Rate: 22 seeds per foot in 7" rows.

Soil Type: Dothan loamy sand.

Soil Test: P = Low, K = Low, and pH = 6.0.

Fertilization: Preplant: 40 lb N, 100 lb P<sub>2</sub>O<sub>5</sub>, and 110 lb K<sub>2</sub>O/acre.

Topdress: 100 lb N/acre.

Management: Disked, moldboard plowed, and rototilled; Harmony Extra used for weed control.

Previous Crop: Soybeans.

Test conducted by D. Dunn, R. Brooke, B. McCranie, and G. South.

1. Yields calculated as 60 pounds per bushel at 13.5% moisture.

2. C.V. = 11.5%, and df for EMS = 132.

**Bolding** indicates entries yielding equal to highest yielding entry within a column based on Fisher's protected LSD (P = 0.10).

Planted: November 27, 2015.

Harvested: May 27, 2016.

Seeding Rate: 22 seeds per foot in 7" rows.

Soil Type: Greenville sandy loam.

Soil Test: P = Medium, K = High, and pH = 5.9.

Fertilization: Preplant: 28 lb N, 80 lb P<sub>2</sub>O<sub>5</sub>, and 80 lb K<sub>2</sub>O/acre.

Topdress: 85 lb N/acre.

Management: Disked, chisel plowed, and rototilled; Presario use for fungal control.

Previous Crop: Peanuts.

Test conducted by D. Dunn, D. Pearce, W. Jones, R. Brooke, G. South, and B. McCranie.

LSD at 10% level	9.0	N.S. <sup>3</sup>		19	2.8	2	24	-
Std. Err. of Entry Mean	3.9	4.8		8.1	1.2	1	10	-

1. Yields calculated as 60 pounds per bushel at 13.5% moisture.

2. C.V. = 21.2%, and df for EMS = 210.

3. The F-test indicated no statistical difference at the alpha = 0.10 probability level; therefore, an LSD value was not calculated.

**Bolding** indicates entries yielding equal to highest yielding entry within a column based on Fisher's protected LSD (P = 0.10).

Planted: November 24, 2015.

Harvested: June 1, 2016.

Seeding Rate: 22 seeds per foot in 7" rows.

Soil Type: Dothan sandy loam.

Soil Test: P = High, K = Medium, and pH = 6.0.

Fertilization: Preplant: 37 lb N, 119 lb P<sub>2</sub>O<sub>5</sub>, and 70 lb K<sub>2</sub>O/acre.

Topdress: 100 lb N/acre.

Management: Subsoiled, field cultivated, and rototilled; Harmony and Express used for weed control; 1000 lb/acre lime.

Previous Crop: Fallow.

Test conducted by D. Dunn, R. Brooke, G. South, and B. McCranie.

## Griffin, Georgia: Wheat Grain Performance, 2015-2016 (Continued)

---

1. Yields calculated as 60 pounds per bushel at 13.5% moisture.
2. Leaf rust data collected on May 10, 2016.
3. C.V. = 10.3%, and df for EMS = 72.
4. The F-test indicated no statistical difference at the alpha = 0.10 probability level; therefore, an LSD value was not calculated.

**Bolding** indicates entries yielding equal to highest yielding entry within a column based on Fisher's protected LSD (P = 0.10).

Planted: October 31, 2015.

Harvested: May 31, 2016.

Seeding Rate: 22 seeds per foot in 7" rows.

Soil Type: Cecil sandy clay.

Soil Test: P = Low, K = High, and pH = 6.1.

Fertilization: Preplant: 20 lb N, 40 lb P<sub>2</sub>O<sub>5</sub>, and 60 lb K<sub>2</sub>O/acre.

Topdress: 70 lb N/acre.

Management: Chisel plowed, disked, and rototilled; Harmony Extra and Prowl used for weed control.

Previous Crop: Corn.

## Calhoun, Georgia: Wheat Grain Performance, 2015-2016 (Continued)

---

1. Yields calculated as 60 pounds per bushel at 13.5% moisture.
2. Rating of 1 - 10; data collected on May 5, 2016.
3. C.V. = 7.9%, and df for EMS = 240.
4. The F-test indicated no statistical difference at the alpha = 0.10 probability level; therefore, an LSD value was not calculated.

**Bolding** indicates entries yielding equal to highest yielding entry within a column based on Fisher's protected LSD (P = 0.10).

Planted: November 17, 2015.

Harvested: June 7, 2016.

Seeding Rate: 22 seeds per foot in 7" rows.

Soil Type: Waynesboro loam.

Soil Test: P = Medium, K = High, and pH = 6.3.

Fertilization: Preplant: 25 lb N, 50 lb P<sub>2</sub>O<sub>5</sub>, and 75 lb K<sub>2</sub>O/acre.

Topdress: 70 lb N/acre.

Management: Chisel plowed, disked, and rototilled; Harmony Extra and Prowl H<sub>2</sub>O used for weed control; 1.5 ton lime/acre.

Previous Crop: Fallow.

Test conducted by H. Jordan, G. Ware, J. Stubbs, and T. Dunn.

LSD at 5% Level	12.8					

1. Yields calculated as 60 pounds per bushel.

2. Days from January 1.

3. Rating: 0 = resistant to 9 = very resistant.

4. C.V. = 10.0%.

**Bolding** indicates entries yielding equal to highest yielding entry within a column based on Fisher's protected LSD (P = 0.10).

Planted: November 24, 2015.

Harvested: May 25, 2016.

Seeding Rate: 22 seeds per foot in 7" rows.

Soil Type: Greenville sandy loam.

Fertilization: Preplant: 15 lb N/acre. Topdress: 80 lb N/acre.

Comments: Problems occurred for some varieties due to long vernalization and susceptibility to stripe rust and leaf rust.

Test conducted by M. Mergoum, J. Johnson, S. Sutton, B. Lopez, and J. Youmans.

1. Triticale: Yields calculated as 48 pounds per bushel at 13.0% moisture.

Rye: Yields calculated as 56 pounds per bushel at 13.0% moisture.

2. C.V. = 11.1%, and df for EMS = 18.

3. The F-test indicated no statistical difference at the alpha = 0.10 probability level; therefore, an LSD value was not calculated.

4. C.V. = 39.0%, and df for EMS = 27.

**Bolding** indicates entries yielding equal to highest yielding entry within a column based on Fisher's protected LSD (P = 0.10).

Planted: November 23, 2016.

Harvested: May 25, 2016.

Seeding Rate: Triticale: 16 seeds per foot in 7" rows.

Rye: 18 seeds per foot in 7" rows.

Soil Type: Dothan loamy sand.

Soil Test: P = High, K = Medium, and pH = 6.4.

Fertilization: Preplant: 50 lb N, 20 lb P<sub>2</sub>O<sub>5</sub>, and 60 lb K<sub>2</sub>O/acre.

Topdress: 100 lb N/acre.

Management: Disked, moldboard plowed, and rototilled; Harmony Extra used for weed control.

Previous Crop: Summer annuals.

Test conducted by D. Dunn, R. Brooke, B. McCranie, and G. South.

1. Yields calculated as 48 pounds per bushel at 13.0% moisture.

2. C.V. = 11.9%, and df for EMS = 21.

3. The F-test indicated no statistical difference at the alpha = 0.10 probability level; therefore, an LSD value was not calculated.

**Bolding** indicates entries yielding equal to highest yielding entry within a column based on Fisher's protected LSD (P = 0.10).

Planted: October 31, 2015.

Harvested: May 31, 2016.

Seeding Rate: 22 seeds per foot in 7" rows.

Soil Type: Cecil sandy clay.

Soil Test: P = Low, K = High, and pH = 6.1.

Fertilization: Preplant: 20 lb N, 40 lb P<sub>2</sub>O<sub>5</sub>, and 60 lb K<sub>2</sub>O/acre.

Topdress: 70 lb N/acre.

Management: Chisel plowed, disked, and rototilled; Harmony Extra and Prowl used for weed control.

Previous Crop: Corn.

Test conducted by H. Jordan, G. Ware, and T. Dunn.

## **Griffin, Georgia: Rye Grain Performance, 2015-2016**

---

A rye grain trial was planted at this location on October 31, 2015. However, drift from glyphosate reduced yield and increased the variability in and among plots. After careful analysis and review of the data, it is the opinion of the editors that the results of this trial may not accurately reflect the genetic performance potential of all the test entries. Since this data is not useful for making decisions and could be misleading if used in making variety selections, it will not be presented in the publication.

---

Std. Err. of Entry Mean	3.1	3.9	6.9	.	.	.	3.1	3.9	6.9

1. Yields calculated at 56 pounds per bushel at 13.0% moisture.

2. Tifton.

3. Tifton data from 2016, 2014, and 2013.

4. Tifton data from 2016 and 2014.

5. Griffin; no data available for 2016.

6. The F-test indicated no statistical difference at the alpha = 0.10 probability level; therefore, an LSD value was not calculated.

**Bolding** indicates entries yielding equal to highest yielding entry within a column based on Fisher's protected LSD (P = 0.10).

## Oat

### Tifton, Georgia: Oat Grain Performance, 2015-2016

---

An oat variety grain trial was planted at this location on September 23, 2015. However, crown rust disease and lodging during the growing season resulted in some very low grain yields and considerable variation in performance within and among plots in the test. After careful analysis and review of the data, it is the opinion of the editors that the results of this trial may not accurately reflect the genetic performance potential of all the test entries. Since this data is not useful for making decisions and could be misleading if used in making variety selections, it will not be presented in the publication.

---

1. Yields calculated as 32 pounds per bushel at 12.5% moisture.

2. Rating of 1 - 5; data collected on April 5, 2016.

3. C.V. = 17.9%, and df for EMS = 69.

4. The F-test indicated no statistical difference at the alpha = 0.10 probability level; therefore, an LSD value was not calculated.

**Bolding** indicates entries yielding equal to highest yielding entry within a column based on Fisher's protected LSD (P = 0.10).

Planted: November 24, 2015.

Harvested: May 27, 2016.

Seeding Rate: 11 seeds per foot in 7" rows.

Soil Type: Greenville sandy loam.

Soil Test: P = Medium, K = High, and pH = 5.9.

Fertilization: Preplant: 28 lb N, 80 lb P<sub>2</sub>O<sub>5</sub>, and 80 lb K<sub>2</sub>O/acre.

Topdress: 52 lb N/acre.

Management: Disked, chisel plowed, and rototilled.

Previous Crop: Peanuts.

Test conducted by D. Dunn, D. Pearce, W. Jones, R. Broooke, G. South, and B. McCranie.

Std. Err. of Entry Mean	3.9	5.6		10.9	2.9	1	8	-

1. Yields calculated as 48 pounds per bushel at 12.0% moisture.

2. C.V. = 21.8%, and df for EMS = 6.

3. The F-test indicated no statistical difference at the alpha = 0.10 probability level; therefore, an LSD value was not calculated.

**Bolding** indicates entries yielding equal to highest yielding entry within a column based on Fisher's protected LSD (P = 0.10).

Planted: November 24, 2015.

Harvested: May 27, 2016.

Seeding Rate: 15 seeds per foot in 7" rows.

Soil Type: Greenville sandy loam.

Soil Test: P = Medium, K = High, and pH = 5.9.

Fertilization: Preplant: 28 lb N, 80 lb P<sub>2</sub>O<sub>5</sub>, and 80 lb K<sub>2</sub>O/acre.

Topdress: 85 lb N/acre.

Management: Disked, chisel plowed, and rototilled.

Previous Crop: Peanuts.

Test conducted by D. Dunn, D. Pearce, W. Jones, R. Brooke, G. South, and B. McCranie.

## Calhoun, Georgia: Barley Grain Performance, 2015-2016

Brand-Variety	Yield <sup>1</sup>		2016 Data

Std. Err. of Entry Mean	2.5	3.8		1.0	1.2	1	-	1

1. Yields calculated as 48 pounds per bushel at 12.0% moisture.

2. C.V. = 3.4%, and df for EMS = 6.

3. The F-test indicated no statistical difference at the alpha = 0.10 probability level; therefore, an LSD value was not calculated.

**Bolding** indicates entries yielding equal to highest yielding entry within a column based on Fisher's protected LSD (P = 0.10).

Planted: November 17, 2015.

Harvested: June 7, 2016.

Seeding Rate: 19 seeds per foot in 7" rows.

Soil Type: Rome gravelly loam.

Soil Test: P = Medium, K = High, and pH = 6.3.

Fertilization: Preplant: 100 lb N, 50 lb P<sub>2</sub>O<sub>5</sub>, and 75 lb K<sub>2</sub>O/acre.

Topdress: 60 lb N/acre.

Management: Chisel plowed, disked, and rototilled; Harmony Extra used for weed control; 1.5 ton lime/acre.

Previous Crop: Fallow.

Test conducted by H. Jordan, G. Ware, J. Stubbs, and T. Dunn.

Previous Crop: Peanuts.

Test conducted by D. Dunn, D. Pearce, W. Jones, R. Brooke, G. South, and B. McCranie.

## **Griffin, Georgia: Wheat Forage Performance, 2015-2016**

---

A wheat variety forage trial was planted at this location on October 24, 2015. However, ryegrass competition due to the lack of control with labeled herbicides during the growing season resulted in only two harvests and considerable variation in performance within and among plots in the test. After careful analysis and review of the data, it is the opinion of the editors that the results of this trial may not accurately reflect the genetic performance potential of all the test entries. Since this data is not useful for making decisions and could be misleading if used in making variety selections, it will not be presented in the publication.

---

## **Marianna, Florida: Wheat Forage Performance, 2015-2016**

---

A wheat variety forage trial was planted at this location on October 30, 2015. However, due to heavy rainfall during early November, experimental plots were washed out, silted over, and/or drowned rendering little to no results. Therefore, there are no results to publish.

---

1. C.V. = 6.6%, and df for EMS = 21.

2. C.V. = 10.3%, and df for EMS = 36.

**Bolding** indicates entries yielding equal to highest yielding entry within a column based on Fisher's protected LSD ( $P = 0.10$ ).

Planted: October 23, 2015.

Seeding Rate: Triticale: 27 seed/foot in 7" rows.

Rye: 36 seed/foot in 7" rows.

Soil Type: Tifton loamy sand.

Soil Test: P = High, K = Medium, and pH = 6.4.

Fertilization: Preplant: 50 lb N, 20 lb  $P_2O_5$ , and 60 lb  $K_2O$ /acre.

Topdress: 50 lb N/acre after 1st, 2nd, 3rd, and 4th harvests.

Management: Disked, moldboard plowed, and rototilled.

Previous Crop: Summer annuals.

Test conducted by D. Dunn, R. Brooke, B. McCranie, and G. South.

## **Marianna, Florida: Triticale and Rye Forage Performance, 2015-2016**

---

Triticale and rye variety forage trials were planted at this location on October 30, 2015. However, due to heavy rainfall during early November, experimental plots were washed out, silted over, and/or drowned rendering little to no results. Therefore, there are no results to publish.

---

1. C.V. = 6.3%, and df for EMS = 48.

**Bolding** indicates entries yielding equal to highest yielding entry within a column based on Fisher's protected LSD (P = 0.10).

Planted: October 23, 2015.

Seeding Rate: 30 seed/foot in 7" rows.

Soil Type: Tifton loamy sand.

Soil Test: P = High, K = Medium, and pH = 6.4.

Fertilization: Preplant: 50 lb N, 20 lb P<sub>2</sub>O<sub>5</sub>, and 60 lb K<sub>2</sub>O/acre.

Topdress: 50 lb N/acre after 1st, 2nd, 3rd, and 4th harvests.

Management: Disked, moldboard plowed, and rototilled.

Previous Crop: Summer annuals.

Test conducted by D. Dunn, R. Brooke, B. McCranie, and G. South.

1. C.V. = 11.3%, and df for EMS = 132.

**Bolding** indicates entries yielding equal to highest yielding entry within a column based on Fisher's protected LSD ( $P = 0.10$ ).

Planted: October 23, 2015.

Seeding Rate: 50 lb/acre in 7" rows.

Soil Type: Tifton loamy sand.

Soil Test: P = High, K = Medium, and pH = 6.4.

Fertilization: Preplant: 50 lb N, 20 lb  $P_2O_5$ , and 60 lb  $K_2O$ /acre.

Topdress: 50 lb N/acre after 1st, 2nd, 3rd, and 4th harvests.

Management: Disked, moldboard plowed, and rototilled.

Previous Crop: Summer annuals.

Test conducted by D. Dunn, R. Brooke, B. McCranie, and G. South.

1. C.V. = 7.9%, and df for EMS = 144.

**Bolding** indicates entries yielding equal to highest yielding entry within a column based on Fisher's protected LSD (P = 0.10).

Planted: October 22, 2015.

Seeding Rate: 50 lb/acre in 7" rows.

Soil Type: Waynesboro loam.

Soil Test: P = Very High, K = Very High, and pH = 5.8.

Fertilization: Preplant: 25 lb N, 50 lb P<sub>2</sub>O<sub>5</sub>, and 75 lb K<sub>2</sub>O/acre.

Topdress: 50 lb N/acre after 1st, 2nd, 3rd, and 4th harvests.

Management: Chisel plowed, disked, and rototilled; Harmony Extra used for weed control; 1.5 ton lime/acre.

Previous Crop: Corn.

Test conducted by H. Jordan, G. Ware, and T. Dunn.

1. C.V. = 11.3%, and df for EMS = 144.
2. The F-test indicated no statistical difference at the alpha = 0.10 probability level; therefore, an LSD value was not calculated.

**Bolding** indicates entries yielding equal to highest yielding entry within a column based on Fisher's protected LSD (P = 0.10).

Planted: October 30, 2015.

Seeding Rate: 50 lb/acre in 7" rows.

Soil Type: Chipola loamy sand.

Soil Test: P = High, K = Medium, and pH = 6.7.

Fertilization: Preplant: 50 lb N, 0 lb P<sub>2</sub>O<sub>5</sub>, and 90 lb K<sub>2</sub>O/acre.

Topdress: 50 lb N/acre after 1st, 2nd, and 3rd harvests.

Management: Moldboard plowed and rototilled; Harmony Extra and 2,4D used for weed control.

Previous Crop: Corn.

Test conducted by J. Jones.

1. The F-test indicated no statistical difference at the alpha = 0.10 probability level; therefore an LSD value was not calculated.

**Bolding** indicates entries yielding equal to highest yielding entry within a column based on Fisher's protected LSD (P = 0.10).

## Sources of Seed for the 2015-2016 Small Grain Performance Tests

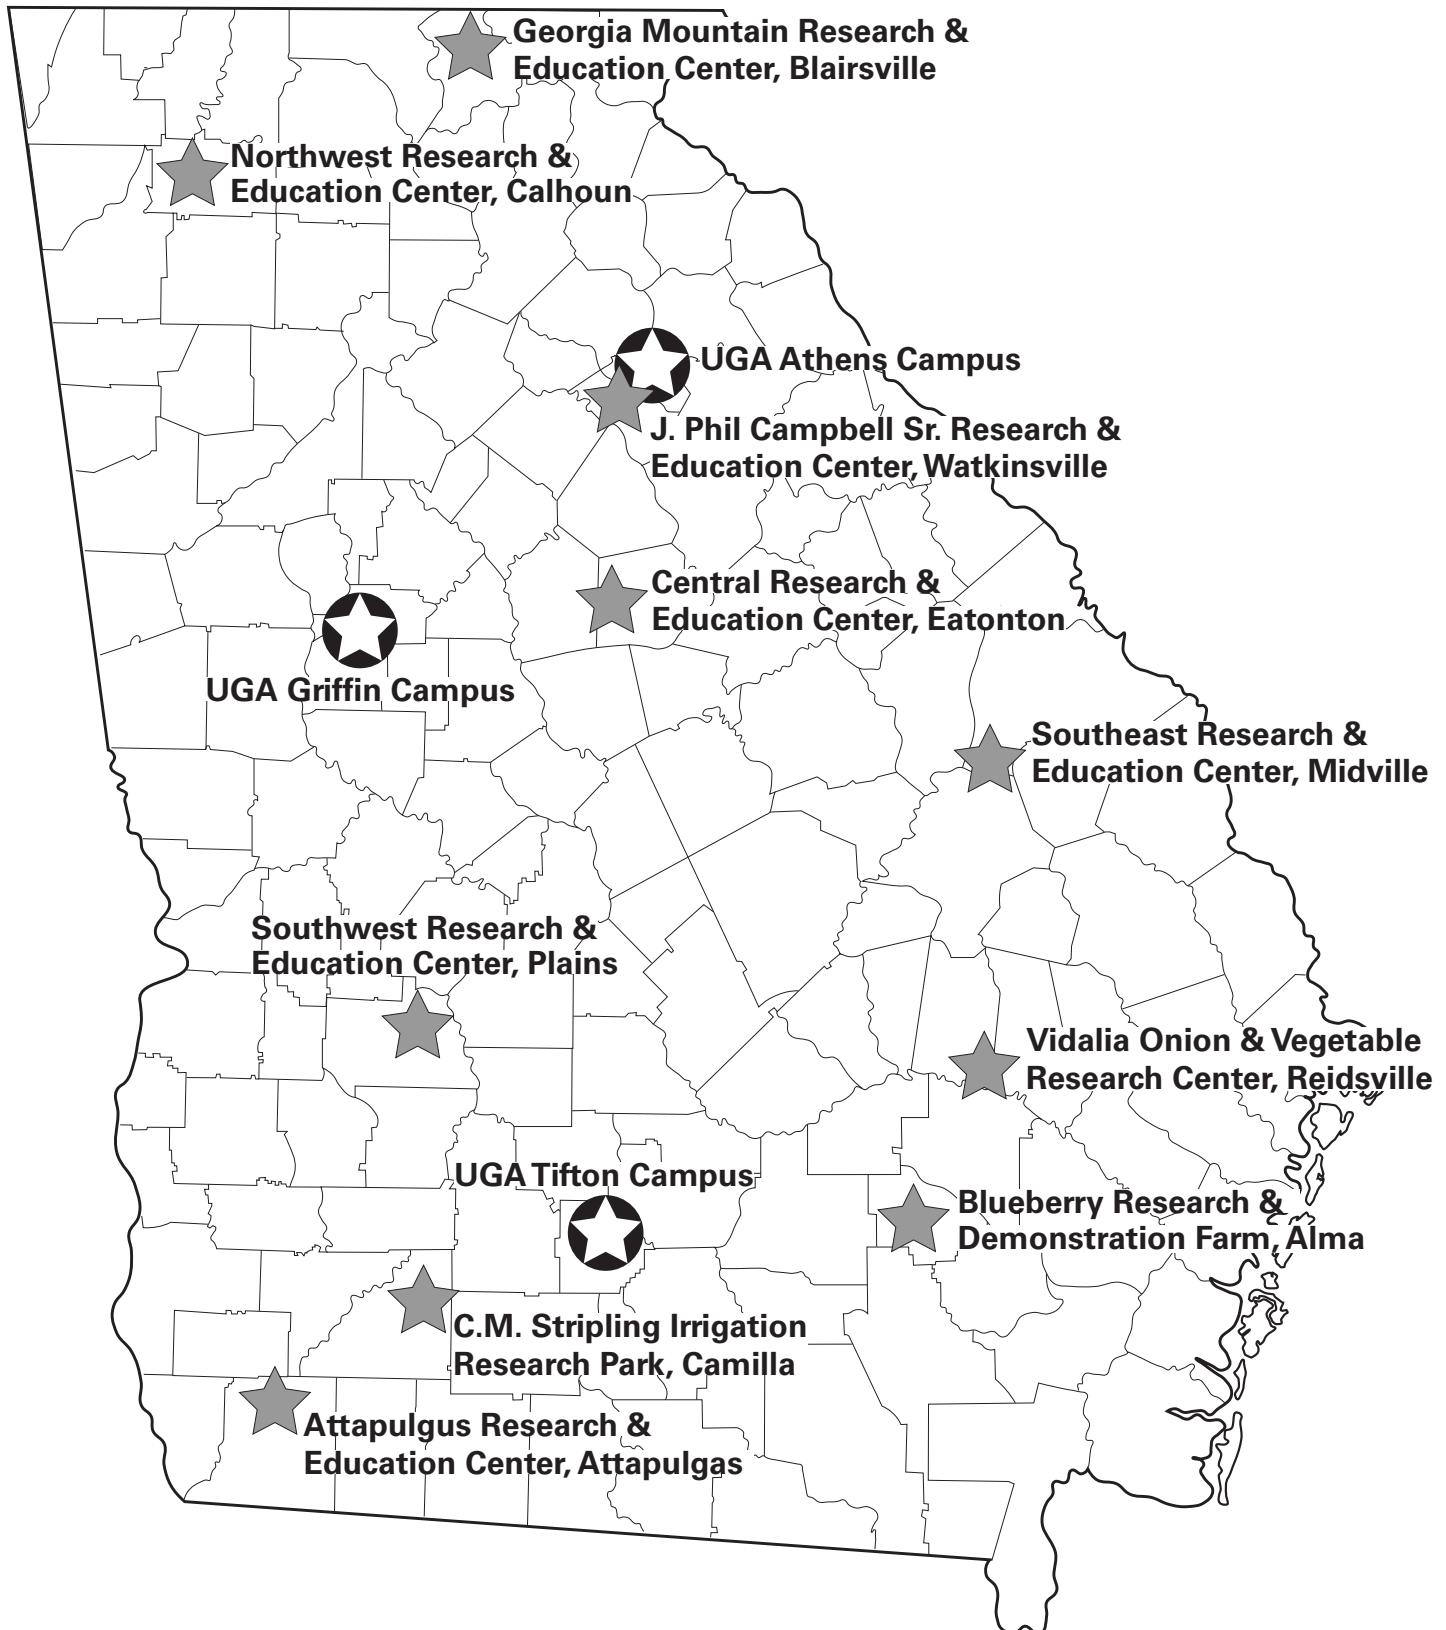

Crop	Variety – Seed Source
<b>Wheat</b>	<ul style="list-style-type: none"> <li>- <b>AGS and Graze-All</b> - AGSouth Genetics, LLC, PO Box 72246, Albany, GA 31708.</li> <li>- <b>AgriMAXX</b> – AgriMAXX Wheat Company, 7167 Highbanks Road, Mascoutah, IL 62258.</li> <li>- <b>AR</b> – University of Arkansas, 115 Plant Sciences Building, 495 N. ## **“CERTIFIED SEED DOESN’T COST ... IT PAYS”**

### **HERE’S WHY:**

- Known performance of varieties adapted to your area.
- A pedigree record that begins with the release of breeder seed and continues until it reaches the consumer as certified (blue tag) seed.
- Field inspected for trueness to variety and inseparable from other crop and weed seed.
- Certified seed can only be conditioned in an approved facility.
- Certified seed must meet high quality standards as to germination and purity.
- Free of noxious weeds.

*The planting of CERTIFIED SEED eliminates many of the risks associated with crop production. For sources of certified seed, contact your local county Extension agent or the Georgia Crop Improvement Association, Inc. at 706-542-2351.*
