TABLE OF CONTENTS

Table No.	Page
1. Equivalents for liquid measure (volume)	4
2. Equivalents for dry measure and weight	5
3. Metric system conversion table	6
4. Dilution of liquid pesticides at various concentrations	7
5. Equivalent quantities of dry materials (wettable powders) for various volumes of water based on recommended pounds per 100 gallons	7
6. Equivalent quantities of liquid materials (emulsion concentrates, etc.) for various volumes of water based on pints per 100 gallons	7
7. Rate of application equivalent table	8
8. Fertilizer conversions for specified square feet and row areas	9
9. Fertilizer weight as measured by standard pot size	10
10. Element concentrations for pounds soluble fertilizer in 1000 gallons (U.S.) water	11
11. Injection ratios and nitrogen concentrations for constant fertilization	12
12. Injector calibration with a conductivity meter	
12A. Peters Single Element Fertilizer Components	13
12B. Peters Mixed Soluble Fertilizer Analysis	14
13. Parts per million of desired nutrient to ounces of fertilizer carrier in 100 gallons of water (or grams in 1 liter) and vice versa	15
14. Conversion factors among electrical conductivity (EC) units	16
15. Various acids to add to irrigation water for acidification	17
16. Amounts of nutrient sources to combine in making various fertilizer formulas	18
17. Formulas for additional fertilizer calculations	19
18. Miscellaneous conversions used in fertilizer calculations	21
19. Osmocote® controlled-release fertilizers and their release periods	22
20. Rates in lb/yd ³ (kg/m ³) for incorporation of three of the most popular formulations of Nutricote into greenhouse root substrates	23
21. Materials, rates necessary to lower the pH level of greenhouse potting substrate 0.5 to 1.0 units	23
22. Approximate amount of materials required to change pH of potting mixes	24

Table No.		Page
23. Dilution/conversion chart for various chemical growth regulators.	24
24. Pre-plant fertilizer sources and rates of application.	28
25. Cornell Peat-lite Mix A for seedlings, bedding plants and potted plants	29
26. Number of pots per bushel and per cubic yard of soil mix	30
27. Number of nursery containers that can be filled from 1 yd ³ of soil mix	31
28. Coverage estimates for perlite, peat, topsoil and straw	31
29. Plant spacing guide (greenhouse)	32
30. Plant spacing guide (field/orchard)	32

Landscape

31. Estimated number of plants to fill 100 ft ² bed area for square (row) and triangular (equilateral) planting patterns using 4 to 14 in. spacing distances	33
32. Number of bedding/groundcover plants required at various spacing for landscape planting	34
33. Number of plants per acre at various spacings	34
34. Times required to mow or trim lawn areas	35
35. Cubic yards of soil needed at various depths and areas	36
36. Areas covered in square feet at various depths	36
37. Temperature conversion	37

Figure No.		Page
1A–1C. Formulas for calculating greenhouse volume	38
2A–2C. Formulas for calculating variously shaped areas	39

Pesticide and fertilizer recommendations often are made on a pounds-per-acre or tons-per-acre basis for field production. However, greenhouse and nursery operators, landscape professionals and orchardists often must convert these recommendations to smaller areas, such as row feet or square feet per tree or per pot. Pints, cups, ounces, tablespoons and teaspoons often are the common units of measure. Metric units of measure can further complicate conversion.

This publication is designed to help growers make these calculations and conversions and to provide other data useful in the management, planning and operation of horticultural enterprises. A number of formulas for calculating fertilizer application rates on a parts-per-million basis are given. Tables for fertilizer injector calibration using a conductivity meter, as well as pre-plant application rates for various soil mix components and amendments, also are provided. A brief explanation of how each table is used is provided.

Tables 1 through 3 help determine equivalent measures for liquid (volume) or dry (weight) chemical substances and also converting metric to English units.

Table 1. Equivalents for liquid measure (volume)								
Gallons	Quarts	Pints	Fluid Ounces	Cupfuls	Tablespoonful	Teaspoonful	Milliliters	Liters
1	4	8	128	16	256	768	3785	3.785

Table 3. Metric system conversion table

This amount	Converts to
Liquid capacity	
1 fluid ounce (fl oz)	30 milliliters (ml)
1 pint (pt) = 16 fl oz	473 ml
1 quart (qt)	946 ml
1 gallon (gal)	3,785 ml
1 liter (L)	1,000 ml
1 milliliter (ml)	1 cubic centimeter (cc)
Dry material capacity	
1 ounce (avoirdupois)	28.4 grams (g)
1 pound (lb)	453.6 g
1 kilogram (kg)	1,000 g = 2.2 lb
Volume	
1 cubic inch (in^3)	16.4 milliliters (ml)
1 cubic foot (ft^3)	7.48 gallons = 28.3 liters (l)
1 bushel (bu)	1.24 ft^3 = 35.2 liters
1 cubic yard (yd^3)	21.7 bu = 765 liters
Linear	
1 inch (in)	2.54 centimeters (cm)
1 foot (ft)	30.48 cm
1 yard (yd)	91.44 cm
1 meter (m)	100 cm
Area	
1 square inch (in^2)	6.45 square centimeters (cm^2)
1 square foot (ft^2)	0.09 square meter (m^2)
1 square yard (yd^2)	0.84 square meter (m^2)
1 acre (a)	0.40 hectare (ha)
1 square mile (M^2)	2.59 square kilometer (km^2)

Tables 4 through 7 help determine correct application rates for various pesticides.

Table 4. Dilution of liquid pesticides at various concentrations

Dilution	Amount Desired			
	1 Gal	3 Gal	Gal	5 Gal
1:100	2 Tbs + 2 tsp	½ cup	¾ cup + 5 tsp	1 cup + 3 Tbs
1:200	4 tsp	¼ cup	6½ Tbs	½ cup + 2 Tbs
1:400	2 tsp	2 Tbs	3 Tbs	4 Tbs + 2½ tsp
1:800	1 tsp	1 Tbs	1 Tbs + 2 tsp	3 Tbs + 2½ tsp
1:1000	¾ tsp	2¼ tsp	1 Tbs + 1 tsp	1 pint + ½ cup

Example: Directions call for a 1:200 dilution. To prepare 3 gallons of finished product, you would need to add ¼ cup.

Table 5. Equivalent quantities of dry materials (wettable powders) for various volumes of water based on recommended pounds per 100 gallons

Water	Recommended Rate					
	1 lb	2 lb	3 lb	4 lb	5 lb	6 lb
50 gal	½ lb	1 lb	1½ lb	2 lb	2½ lb	3 lb
25 gal	4 oz	8 oz	12 oz	1 lb	1¼ lb	1½ lb
12.5 gal	2 oz	4 oz	6 oz	8 oz	10 oz	¾ lb
5 gal	3 Tbs	1½ oz	2½ oz	3¼ oz	4 oz	5 oz
1 gal	1 tsp	2 tsp	1 Tbs	4 tsp	5 tsp	2 Tbs

Example: Directions for use specify a rate of 4 lb per 100 gallons of water. To prepare 1 gallon of solution would require 4 tsp of material.

Table 6. Equivalent quantities of liquid materials (emulsion concentrates, etc.) for various volumes of water based on pints per 100 gallons

Water 100 gal	Recommended Rate					
	½ pt	1 pt	2 pt	3 pt	4 pt	5 pt
50 gal	4 fl oz	8 fl oz	1 pt	1½ pt	2 pt	2½ pt
25 gal	2 fl oz	4 fl oz	8 fl oz	12 fl oz	1 pt	1¼ pt
12.5 gal	1 fl oz	2 fl oz	4 fl oz	6 fl oz	8 fl oz	10 fl oz
5 gal	1 Tbs	1 fl oz	2 fl oz	2½ fl oz	3 fl oz	4 fl oz
1 gal	½ tsp	1 tsp	2 tsp	3 tsp	4 tsp	5 tsp

Example: Directions for use specify a rate of 4 pt per 100 gallons of water. To prepare 5 gallons of solution would require 3 fl oz of material.

Table 7. Rate of application equivalent table

Rate per Acre	Rate per 1000 sq ft	Rate per 100 sq ft
Liquid Materials		
1 pint	3/4 Tbs	1/4 tsp
1 quart	1 1/2 Tbs	1/2 tsp
1 gallon	6 Tbs	2 tsp
25 gallons	4 2/3 pints	1/2 pint
50 gallons	4 2/3 quarts	1 pint
100 gallons	2 1/3 gallons	1 quart
200 gallons	4 2/3 gallons	2 quarts
300 gallons	7 gallons	3 quarts
400 gallons	9 1/4 gallons	1 gallon
500 gallons	11 1/2 gallons	1 1/4 gallon
Dry Materials		
1 lb	2 1/2 tsp	1/4 tsp
3 lb	2 1/4 Tbs	3/4 tsp
4 lb	3 Tbs	1 tsp
5 lb	4 Tbs	1 1/4 tsp
10 lb	1/2 cup	2 tsp
100 lb	2 1/4 lb	1/4 lb
200 lb	4 2/3 lb	1/2 lb
300 lb	7 lb	3/4 lb
400 lb	9 1/4 lb	1 lb
500 lb	11 1/2 lb	1 1/4 lb

Examples: For liquid materials, 100 gallons per acre is equivalent to 2 1/3 gallons per 1000 ft² or 1 quart per 100 ft². For dry materials, 4 lb per acre is equivalent to 3 Tbs per 1000 ft² or 1 tsp per 100 ft².

Tables 8 through 9 help determine the correct application rates for fertilizers when nutrition recommendations are based on fertilizer weight.

Table 8. Fertilizer conversions for specified square feet and row area

Material grouped by approximate weight per pint	Fertilizer rate for specific areas							
	Recommended rate per acre* lb	100 sq ft lb	1000 sq lb	10 sq ft Tbs	100 sq ft pt	1 ft Tbs	2 ft Tbs	3 ft cup
10 oz per pint Sulfur or Dried Blood	100	0.2	2.3	1.2	0.4	1.2	2.4	0.2
	500	1.2	11.5	6.0	1.9	6.0	12.0	1.1
	1000	2.3	23.0	12.0	3.7	-	-	-
13 oz per pint Urea or Ammonium Nitrate or Ammonium Chloride	100	0.2	2.3	0.9	0.3	0.9	1.8	0.2
	500	1.2	11.5	4.5	1.4	4.5	9.0	0.8
	1000	2.3	23.0	9.0	2.8	-	-	-
16 oz per pint Ammonium Phosphate or Potassium Chloride or Gypsum or Mixed Fertilizers	100	0.2	2.3	0.7	0.2	0.7	1.4	0.1
	500	1.2	11.5	3.5	1.2	3.5	7.0	0.7
	1000	2.3	23.0	7.0	2.3	-	-	-
19 oz per pint Calcium Nitrate or Ammonium Sulfate or Superphosphate	100	0.2	2.3	0.6	0.2	0.6	1.2	0.1
	500	1.2	11.5	3.0	1.0	3.0	6.0	0.6
	1000	2.3	23.0	6.0	2.0	-	-	-
23 oz per pint Ground Limestone or Potassium Sulfate	100	0.2	2.3	0.5	0.2	0.5	1.0	0.1
	500	1.2	11.5	2.5	0.8	2.5	5.0	0.5
	1000	2.3	23.0	5.0	1.6	-	-	-
	2000	4.6	46.0	10.0	3.2	-	-	-

* Any of the materials listed in the first column can be used at the rates shown below. **High Rates, not desirable in row fertilization, are omitted in the table. **Example:** You wish to apply calcium nitrate at the rate of 500 lb per acre. It weighs approximately 19 oz per pint. For application to 100 ft², you need 1.2 lb or 1.0 pint.

Table 9. Fertilizer weight as measured by standard pot size

Fertilizer	Pot Size					
	2½ in.	3 in.	3½ in.	4 in.	5 in.	6 in.
Ammonium nitrate	2 oz	5½ oz	9 oz	15 oz	1 lb 12 oz	2 lb 15 oz
Urea, 45-0-0	2½ oz	6 oz	9 oz	1 lb	1 lb 13 oz	3 lb
Superphosphate	2½ oz	6 oz	9½ oz	1 lb	1 lb 14 oz	3 lb 2 oz
Dusting sulfur	2½ oz	6 oz	10 oz	1 lb	1 lb 14 oz	3 lb 3 oz
Peters, 20-5-30	2½ oz	6 oz	10 oz	1 lb 1 oz	1 lb 15 oz	3 lb 3 oz
Ammonium sulfate	3 oz	7 oz	11 oz	1 lb 3 oz	2 lb 3 oz	3 lb 11 oz
Osmocote, 14-14-14	3 oz	7½ oz	12 oz	1 lb 4 oz	2 lb 5 oz	3 lb 13 oz
MagAmp, 12-62-0	3 oz	7½ oz	12 oz	1 lb 4 oz	2 lb 5 oz	3 lb 14 oz
Gypsum, CaSO ₄	3 oz	8 oz	12½ oz	1 lb 5 oz	2 lb 7 oz	4 lb 1 oz
Calcium nitrate	3 oz	8 oz	12½ oz	1 lb 6 oz	2 lb 8 oz	4 lb 2 oz
Peters, 15-0-15	3½ oz	8 oz	13 oz	1 lb 6 oz	2 lb 9 oz	4 lb 5 oz
Potassium chloride	3½ oz	9 oz	14 oz	1 lb 8 oz	2 lb 12 oz	4 lb 9 oz
Sodium nitrate	4 oz	9 oz	15 oz	1 lb 9 oz	2 lb 14 oz	4 lb 13 oz
Dolomitic limestone	5½ oz	13 oz	1 lb 5 oz	2 lb 4 oz	4 lb 2 oz	6 lb 14 oz

Clay flower pots are frequently used for fertilizer measurement by greenhouse operators. The above shows average weights of several representative fertilizers as measured by standard clay pots when level full. The 3-in. standard is considered to contain 8 fl oz or 1 cup. Since the actual pot size varies with the manufacturer and the volume of a given weight of fertilizer varies with moisture and compaction, deviations of 10% may be expected but up to 40% may occur.

Tables 10 through 14 help determine the correct application rates for fertilizers with various analysis when nutrition recommendations are based on parts per million and fertilizer injectors are used to deliver liquid plant fertilizer. Table 12 is designed to help growers calibrate their injectors.

Table 10. Element concentrations for pounds soluble fertilizer in 1000 gallons (U.S.) water

Desired ppm	Pounds of Fertilizer Needed												
	% Nitrogen (N)					% Phosphate (P_2O_5)					% Potash (K_2O)		
30	25	20	15	10	20	15	10	5	25	20	15	10	
300	8.3	10.0	12.5	16.7	23.0	--	--	--	12.0	15.0	20.0	30.0	
275	7.8	9.2	11.4	15.3	23.0	--	--	--	11.0	13.7	18.2	27.5	
250	7.3	8.4	10.2	13.9	21.8	--	--	--	10.0	12.5	16.7	26.2	
225	6.2	7.5	9.3	12.5	18.7	--	--	--	9.0	11.3	15.0	22.5	
200	5.6	6.7	8.4	11.1	16.7	19.2	--	--	8.0	10.0	13.3	20.0	
175	4.9	5.8	7.3	9.7	14.6	16.8	22.4	--	7.0	8.8	10.7	17.5	
150	4.2	5.0	6.3	8.3	12.5	14.4	19.2	28.8	--	6.0	7.6	10.0	15.0
125	3.5	4.2	5.3	7.0	10.2	12.0	16.0	24.0	48.0	5.0	6.2	8.4	12.5
100	2.8	3.4	4.2	5.6	8.3	9.6	12.6	19.2	38.4	4.0	5.0	6.7	10.0
75	2.1	2.5	3.1	4.2	6.2	7.2	9.6	14.4	28.8	3.0	3.8	5.0	7.5
50	1.4	1.7	2.1	2.8	4.2	4.8	6.4	9.6	19.2	2.0	2.5	3.4	5.0
25	0.7	0.9	1.1	1.4	2.1	2.4	3.2	4.8	9.6	1.0	1.3	1.7	2.5

Example: You wish to apply 200 ppm N using a 20-10-20 soluble fertilizer. Reading across from 200 ppm under the 20 percent N column, you find 8.4 lb are needed for 1000 gallons water.

NOTES: 1 oz/2 gallons is about 30 lb/1000 gallons; 1 oz/3 gallons is about 20 lb/100 gallons; 1 oz/5 gallons is about 12 lb/1000 gallons; 1 oz/gallon = 7490 ppm; 1 oz/100 gallons = 75 ppm.

To determine parts per million (ppm) of an element in a fertilizer, simply multiply the percent of that element by 75. The answer will be the ppm of the element per oz of the fertilizer in 100 gallons of water. As an example, ammonium sulfate contains approximately 20% nitrogen. Twenty percent multiplied by 75 is 15, which is the ppm of nitrogen in 1 oz of ammonium sulfate per 100 gallons of water.

Table 11. Injection ratios and nitrogen concentrations for constant fertilization

oz fertilizer per gallon concentrate				oz fertilizer per gallon concentrate

NOTES:

- 1) For use with meters in millimhos with Peters® Single Element Fertilizer Components.
- 2) These are readings made with distilled water.
- 3) Test your plain irrigation water first and subtract that reading from the fertilizer-injected water. For example, your water test indicates 0.5 mmhos and you are applying 500 ppm N with calcium nitrate. Your calibration reading is $3.70 - 0.5 = 3.20$ mmhos.

B. Peters Mixed Soluble Fertilizer Analysis

Table 14. Conversion factors among electrical conductivity (EC) units

From	To	Multiply by:
mmhos/cm or mS/cm or dS/cm	mhos $\times 10^{-5}$ /cm	100
mhos $\times 10^{-5}$ /cm	mmhos/cm or mS/cm or dS/cm	0.01
mmhos/cm or mS/cm or dS/cm	μmhos or mhos $\times 10^{-6}$	1000
μmhos or mhos $\times 10^{-6}$	mmhos/cm or mS/cm or dS/cm	0.001
mmhos/cm or mS/cm or dS/cm	ppm	670*
ppm	mmhos/cm or mS/cm or dS/cm	0.0014925*
mhos $\times 10^{-5}$ /cm	ppm	6.70*
ppm	mhos $\times 10^{-5}$ /cm	0.14925*
μmhos or mhos $\times 10^{-6}$	ppm	0.670*
ppm	μmhos or mhos $\times 10^{-6}$	1.4925*

Adapted from T.J. Cavins, et al., 2000.

* Some labs report EC in terms of ppm or convert EC to ppm. Although 670 is the basis used in this example, the conversion factor can vary between 640 and 700. This conversion factor is an average due to the variability in the type of fertilizer salts that contribute to the substrate EC in each sample, and it should be considered a broad approximation. Expressing EC in terms of mS/cm or mhos/cm is the preferred method.

Table 15 is designed to help growers decide which acid to add and in what quantities to acidify their irrigation water.

Table 15. Various acids to add to irrigation water for acidification						
Alternative Acids to Add to Irrigation Water						
Amounts	Phosphoric Acid (75%)	Phosphoric Acid (85%)	Sulfuric Acid (35%)	Sulfuric Acid (93%)	Nitric Acid (61.4%)	Nitric Acid (67%)
For Small Volumes						
ml per liter	0.253	0.207	0.348	0.087	0.234	0.209
fl oz per gallon	0.032	0.027	0.044	0.011	0.030	0.027
ml per gallon	0.956	0.785	1.316	0.330	0.884	0.793
For a 1:100 Injector

ml per gallon (conc.)	95.63	78.47	131.59	32.98	88.40	79.28
For a 1:128 Injector						
fl oz per gallon (conc.)	4.14	3.40	5.70	1.43	3.83	3.43
ml per gallon (conc.)	122.41	100.44	168.44	42.22	113.16	101.48
For a 1:200 Injector						
fl oz per gallon (conc.)	6.47	5.31	8.90	2.23	5.98	5.36
ml per gallon (conc.)	191.27	156.94	263.19	65.97	176.81	158.56
Nutrients Added by Each Type of Acid						
Nutrients Added	Phosphorus	Phosphorus	Sulfur	Sulfur	Nitrogen	Nitrogen
Amount Added (ppm)	94.6	94.6	50.3	50.3	43.7	43.7
Note: The table is an example from software called <i>Alkalinity Calculator</i> . It is an acidification analysis done on a water sample with a starting pH of 8.0 and alkalinity of 200 ppm CaCO ₃ acidified to an end point pH of 5.8. For your specific water sample, visit the <i>Alkalinity Calculator</i> and follow the directions. You will need to obtain a water report on your irrigation water prior to running the software. You will need to know the water pH and alkalinity of your sample and have an idea about what end-point pH you want to obtain after acidification. The software also gives you information about the cost of the acidification treatment. Visit the <i>AlkCalc</i> : https://extension.unh.edu/agric/AGGHFL/alk_calc.cfm <i>Use the information above for modifying your fertility program.</i>						

Tables 16 through 20 help determine which fertilizers to use based on chemical analysis, reaction in substrate, longevity in substrate (slow release fertilizers), and incorporation rates for some popular slow release fertilizers. Tables 17 and 18 are specifically designed to provide detailed information on fertilizer calculations, which also aid determine correct application rates.

Table 16. Amounts of nutrient sources to combine in making various fertilizer formulas

Fertilizer Name	Analysis	Nutrient Sources ^a										% of N as $\text{NH}_4 + \text{Urea}$	Reaction in Substrate [*]
		33-0-0	13-0-44	15.5-0-0	16-0-0	21-0-0	45-0-0	0-0-60	12-62-0	21-53-0

Acid	21-9-9	3	1		7		1		2	79	VA		
Spring carnation	10-0-17			5			2			0	B		
Winter nitrate	15-0-15		1	2						5	B		
Winter potash	15-0-22		1	1						4	B		
Lily substitute	16-4-12	1	4	6					1	22	N		
High K	15-10-30		7	1					2	28	N		

^a For names of nutrient sources, see the first nine entries in the Name column.

^b Diammonium phosphate may be pelletized and coated. To dissolve, use very hot water and stir vigorously. Sediment formation should not cause concern. Use crystalline potassium chloride if possible.

* B = basic; N = neutral; SA = slightly acid; A = acid; VA = very acid.

NOTE: For example, an 18-0-22 formula fertilizer can be formulated by blending together 1 lb of ammonium nitrate plus 2 lb of potassium nitrate plus 1 lb of ammonium sulfate. This formulation is determined by locating the 18-0-22 formula in the Analysis column. Then the three numbers 1, 2 and 1 are located in the row after this formula. Each of the three numbers is traced to the X above it and then to the nutrient source to the left of the X.

Table 17. Formulas for additional fertilizer calculations

Compound	Formula	Formula Weight
Ammonium Nitrate	NH_4NO_3	80.8
Ammonium Sulfate	$(\text{NH}_4)_2\text{SO}_4$	132.0
Calcium Nitrate	$\text{Ca}(\text{NO}_3)_2$	164.0
Potassium Nitrate	KNO_3	101.1
Potassium Chloride	KCl	74.6
Potassium Sulfate	K_2SO_4	174.2
Urea	$\text{CO}(\text{NH}_2)_2$	60.0
Element	Symbol	Atomic Weight
Calcium	Ca	40.1
Carbon	C	12.0
Chlorine	Cl	35.5
Hydrogen	H	1.0
Nitrogen	N	14.0
Oxygen	O	16.0
Phosphorus	P	31.0
Potassium	K	39.1

Using Chemicals

To calculate	Use this formula
1) mg of fertilizer source/liter of water =	$\frac{(\text{ppm})(\text{formula weight})}{(\text{atomic weight of element})(\text{number of units in formula of fertilizer source})}$
2) ppm =	$\frac{(\text{mg of fertilizer/liter of water})(\text{atomic weight of element})}{(\text{number of units of element in formula of fertilizer source})}$ $(\text{formula weight of fertilizer source})$
3) to convert mg/l to lb/100 gallon, multiply mg by 0.0008344	
4) to convert lb/100 gallons to mg/l, divide lb by 0.0008344	
EXAMPLE:	<p>How many pounds of potassium sulfate (K_2SO_4) need to be dissolved in 100 gallons of water to make 100 ppm K solution.</p> <p>Get the formula weight of potassium sulfate (K_2SO_4) and the atomic weight of potassium from Table 14 (page 15).</p> <p>Then:</p> <p>1) mg of K_2SO_4 / liter of water = $(100 \times 174.2) \div (39.1 \times 2) = 222.8 \text{ mg/L}$ 2) $222.8 \text{ mg/L} \times 0.00083440 = 0.186 \text{ lb potassium sulfate/100 gal}$</p>

Using Premixed Fertilizers

To calculate	Use this formula
1) mg of mixed fertilizer/liter of water =	$\frac{(\text{ppm of N desired})(100)}{(\% \text{ N in fertilizer})}$
2) ppm of P =	$\frac{(\text{mg of mixed fertilizer/liter of water})(\% \text{ P}_2\text{O}_5)(0.4366)}{100}$
3) ppm of K =	$\frac{(\text{mg of mixed fertilizer/liter of water})(\% \text{ K}_2\text{O})(0.8301)}{100}$
4) mg of mixed fertilizer/liter of water =	$\frac{(\text{ppm of P desired})(100)}{(\% \text{ P}_2\text{O}_5)(0.4366)}$
5) mg of mixed fertilizer/liter of water =	$\frac{(\text{ppm of K desired})(100)}{(\% \text{ K}_2\text{O})(0.8301)}$
6) mg of mixed fertilizer/liter of water =	$\frac{(\text{mg of mixed fertilizer/liter of water})(\% \text{ N})}{10}$

Table 18. Miscellaneous conversions used in fertilizer calculations

1 millimeter or cubic centimeter of water weighs 1 gram		
1 liter of water weighs 1 kilogram		
1 gallon of water weighs 8.34 lb		
1 part per million (ppm)	= 0.0001 percent	
1 part per million	= 1 mg per L	
1 part per million	= 0.013 oz in 100 gallons of water	
1 percent	= 10,000 ppm	
1 percent	10 g per L	
1 percent	10,000 g per kg	
1 percent	1.33 oz by weight per gallon of water	
1 percent	8.34 lb per 100 gallons of water	
0.1 percent	= 1000 ppm	= 1000 mg per L
0.01 percent	= 100 ppm	= 100 mg per L
0.001 percent	= 100 ppm	= 10 mg per L
0.0001 percent	= 100 ppm	= 1 mg per L

Approximate weight-volume measurements for making small volumes of water soluble fertilizers

1 cup	= 8 oz or ½ lb of fertilizer	1 tablespoon	= 0.5 oz of fertilizer
2 cups	= 1 lb of fertilizer	2 tablespoons	= 1 oz of fertilizer

Useful conversions

1 ton/acre	= 20.8 grams/square foot	100 lb/acre	= 0.2296 lb/100 square feet
1 ton/acre	= 1 lb/21.78 square feet	grams/square foot x 96	= lb/acre
1 gram/square foot	= 96 lb/acre	lb/square foot x 43,560	= lb/acre

Tables 21 through 22 are designed to assist growers in correcting the pH of the growing substrate.

Table 21. Materials and rates necessary to lower the pH level of greenhouse potting substrate 0.5 to 1.0 units

Material	Pounds to incorporate in lb/yd ³	Pounds to dissolve in 100 gallons of water ^a	Rate of change in pH
Aluminum sulfate	1.5	6.0	Rapid
Iron sulfate	1.5	6.0	Moderate
Finely-ground elemental sulfur	0.75	-	Slow

^a Apply this drench as a normal watering, about 1 quart per square foot or 8 fluid ounces per 6-in. pot.

Adapted from Bailey, D.A. 1996.

Table 22. Approximate amount of materials required to change pH of peat-based potting mixes

Pounds per cubic yard to change acidity to pH 5.7 for:		
Beginning pH	50% Peat 50% Bark	100% Peat
7.5 ²	2.0	3.4
7.0	1.5	2.5
6.5	1.0	2.0
5.0³	2.5	3.5
4.5	5.6	7.4
4.0	7.9	11.5*
3.5	10.5*	15.58

² Add sulfur or acidifying mixture to lower pH to 5.7.
³ **Add dolomitic lime or equivalent amount of calcium to raise pH to 5.7.**
* Addition of more than 10 lb of dolomitic per yd³ can cause micronutrient deficiencies.

Adapted from Conover, C.A., and R.T. Poole. 1984.

Adapted from Hammer, P.A. 1992.

Tables 24 through 25 are designed to assist growers who desire to prepare their own substrate mix.

Table 24. Pre-plant fertilizer sources and rates of application^{1,2}

Nutrient source	Rate per cubic yard (per m ³)	
	Soil-based media	Soilless media
To provide calcium and magnesium		
When a pH rise is desired:		
Dolomitic limestone	0–10 lb (0–6 kg)	10 lb (6 kg)
When no pH shift is desired:		
Gypsum for calcium	0–5 lb (0–3 kg)	0–5 lb (0–3 kg)
Epsom salt for magnesium	0–1 lb (0–0.6 kg)	0–1 lb (0–0.6 kg)
To provide phosphorus³		
Superphosphate (0-45-0), or	1.5 lb (0.9 kg)	2.25 lb (1.3 kg)
To provide sulfur		
Gypsum (calcium sulfate)	1.5 lb (0.9 kg)	1.5 lb (0.9 kg)
To provide micronutrients: iron, manganese, zinc, copper, boron, molybdenum		
Esmigran	3–6 lb (1.8–3.6 kg)	3–6 lb (1.8–3.6 kg)
Micromax	1–1.5 lb (0.6–0.9 kg)	1–1.5 lb (0.6–0.9 kg)
Promax	1–1.5 lb (0.6–0.9 kg)	1–1.5 lb (0.6–0.9 kg)
F-555HF	3 oz (112 g)	3 oz (112 g)
F-111HR	1 lb (0.6 kg)	1 lb (0.6 kg)
To provide nitrogen and potassium (optional)		
Calcium nitrate, or	1 lb (0.6 kg)	1 lb (0.6 kg)
Potassium nitrate	1 lb (0.6 kg)	1 lb (0.6 kg)

¹ From Nelson, P.V. 1998. Greenhouse Operations and Management, 5th ed. Published by Prentice Hall, Inc. Reprinted with permission.

² Rates in this table are for crops other than seedlings. Only limestone is necessary in seedling substrates. Optional nutrient sources for seedling substrate include up to 1 lb (0.6 kg) each of superphosphate, gypsum, and calcium nitrate; no potassium nitrate; and the low end of the rate range for micronutrients.

³ These are maximum rates designed to supply phosphorus for 3 to 4 months if pH is maintained in a desirable range for the crop and the leaching percentage is at or below 20%.

Table 25. Cornell Peat-Lite Mix A for seedlings, bedding plants and potted plants*

Materials Used	Amount per Cubic Yard¹	Amount per Bushel
Spagnum peat moss	0.5 cubic yard (13 bushels)	0.5 bushel
Horticultural grade vermiculite #2 size for seed germination #2 or 3 for transplanting	0.5 cubic yard (13 bushels)	0.5 bushel
Superphosphate, or	1 to 2 lb	20.5 to 41.0 grams (1 to 2 tablespoons)
Treble superphosphate ²	0.5 to 1 lb	10.3 to 20.5 grams (0.6 to 1.2 tablespoons)
Ground dolomitic limestone ²	5 to 10 lb	103 to 206 grams (5.2 to 10.4 tablespoons)
Gypsum ²	2.0 lb	41 grams (2.5 tablespoons)
Calcium nitrate	0.5 lb	10 grams (1.2 tablespoons)
Potassium nitrate	0.5 lb	10 grams (1.2 tablespoons)
Trace element material (Use Only One)		
Esmigran, or	4.0 lb	81 grams (4.0 tablespoons)
Micromax	1.5 lb	31 grams (1.7 tablespoons)
Wetting agent (Use Only One)³		
Aqua-Gro 2000 granular or	1.0 lb	----
Aqua-Gro 2000-L liquid ⁴	3-5 fluid ounces	0.5 level teaspoon
PsiMatic liquid ⁵	2-4 fluid ounces	0.5 level teaspoon

¹ A cubic yard equals 27 cubic feet or approximately 22 bushels. A 15% to 20% shrink occurs in mixing. Therefore, an additional 5 cubic feet or 4 bushels are used to obtain a full cubic yard.

² If treble superphosphate is used, gypsum is added to supply sulphur. If only 5 lb of limestone are used for pH control, then add the gypsum that supplied calcium and sulphur.

³ The granular Aqua-Grow is preferred.

⁴ 3 oz/yard for germination/seedlings, 5 oz/yard for bedding plants and pot plants.

⁵ 2 oz/yard for germination/seedlings, 4 oz/yard for bedding plants and pot plants.

* Adapted from Fonteno. W.C. 1994

Soil Mix Volumes

1 bushel = 1¼ cu ft

1 cubic yard = 27 cu ft

1 cu yard = 22 bushels

100 sq ft of bench area (at 6 in. soil depth) = 50 cu ft or 40 bushels of soil mix.

Table 28. Coverage estimates for perlite, peat, topsoil and straw

Thickness	4 cu ft Perlite	6 cu ft Canadian Peat (12 cu ft loose)	1 cu yd* Peat Mulches, Topsoil, etc.	1 Bale	
				Pinestraw	Wheatstraw
2 in.	28 sq ft	72 sq ft	162 sq ft	90 sq ft	180 sq ft
1 in.	48 sq ft	144 sq ft	324 sq ft	180 sq ft	360 sq ft
½ in.	96 sq ft	288 sq ft	648 sq ft	360 sq ft	720 sq ft
¼ in.	192 sq ft	576 sq ft	1296 sq ft	720 sq ft	1440 sq ft

* cubic yard (yd³) = 27 cubic feet (ft³)

Tables 29 through 30 help determine correct spacing and number of plants at each spacing for both greenhouse and field situations.

Table 29. Plant spacing guide (greenhouse)

Spacing	Plants/sq ft	Plants/acre of production area	Plants/acre of ground covered*
8" x 9"	2.0	87,000	58,000
8" x 8"	2.3	98,000	65,000
8" x 7"	2.6	114,000	76,000
8" x 6"	3.0	30,000	87,000
6" x 7"	3.4	147,000	98,000
6" x 6"	4.0	174,000	116,000
6" x 5"	4.8	208,000	139,000
5" x 5"	5.8	252,000	168,000
5" x 4"	7.2	313,000	209,000
5" x 3"	9.6	418,000	279,000
4" x 3"	12.0	522,000	348,000

*Assuming 1/3 of production area devoted to aisles, etc.

Table 30. Plant spacing guide (field/orchard)

Spacing Between Rows of Plants	Spacing Between Plants Within the Row

Number of Plants per Acre

To determine the number of plants per acre for spacing not given in the table, multiply the distance in the row by the distance between rows and divide that number into 43,560.

Landscape

Tables 31 through 36 are designed to aid landscape professionals and homeowners in determining number of plants at various spacings, cubic yards of soil needed at various depths and areas, areas covered in square feet at various depths, time needed to trim lawns, and the volume of water delivered as affected by the size of irrigation hose.

Table 31. Estimated number of plants to fill 100 ft² of bed area for square (row) and triangular (equilateral) planting patterns using 4- to 14-in. spacing distances

Planting Pattern		Inches between rows of plants (Y)	Inches between plants (X) within rows	Estimated number of plants per 100 ft ²
Square				
For square spacing, the distance between plants within rows (x) equals the distance between rows (Y)		4	4	900
		6	6	400
		8	8	225
		10	10	144
		12	12	100
		14	14	74
Triangular				
For triangular spacing, the distance between plants within rows and between rows both equal X, and the distance between rows (Y) equals 0.886 X.		3.46	4	1039
		5.20	6	462
		6.93	8	260
		8.66	10	166
		10.39	12	115
		12.12	14	85

Adapted from Bailey, D.A., and M.A. Powell. 1999.

Table 32. Volume of water delivered – by size of hose (in gallons per minute)

Water Pressure (lb)	Hose Diameter						
	3/8 in.	13/32 in.	7/16 in.	1/2 in.	9/16 in.	3/4 in.	5/8 in.
30	2.6	3.2	3.8	5.3	7.2	9.3	14.5
40	3.5	4.2	5.0	7.0	9.4	12.2	19.0

	8	2592	1296	864	648	520	432

Table 37 deals with temperature conversion.

Table 37. Temperature conversion			
from Fahrenheit	to Centigrade (Celsius)	from Centigrade (Celsius)	to Fahrenheit
0	-17.8	-30	-22.0
5	-15.0	-25	-13.0
10	-12.2	-20	-4.0
15	-9.4	-15	5.0
20	-6.7	-10	14.0
25	-3.9	-5	23.0
30	-1.1	0	32.0
35	1.7	5	41.0
40	4.4	10	50.0
45	7.2	15	59.0
50	10.0	20	68.0
55	12.8	25	77.0
60	15.6	30	86.0
65	18.3	35	95.0
70	21.1	40	104.4
75	23.9	45	113.0
80	26.7	50	122.0
85	29.4	55	131.0
90	32.2	60	140.0
95	35.0	80	176.0
100	37.8	100	212.0

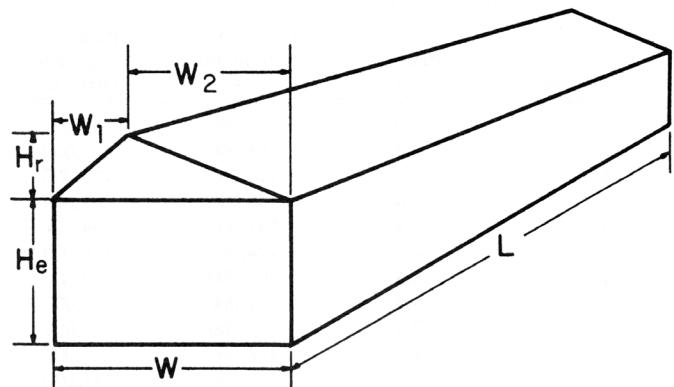

NOTES: 1) To convert temperature in degrees from Centigrade (Celsius) to temperature in degrees Fahrenheit: multiply Centigrade temperature by **1.8** and add **32**. 2) To convert temperature in degrees Fahrenheit to temperature in degrees Centigrade (Celsius): subtract **32** and multiply by **0.55**.

Formulas for calculating greenhouse volumes

These formulas are helpful in determining heating and cooling costs for greenhouses.

Figure 1-A. Formula for calculating uneven-span greenhouse volume.

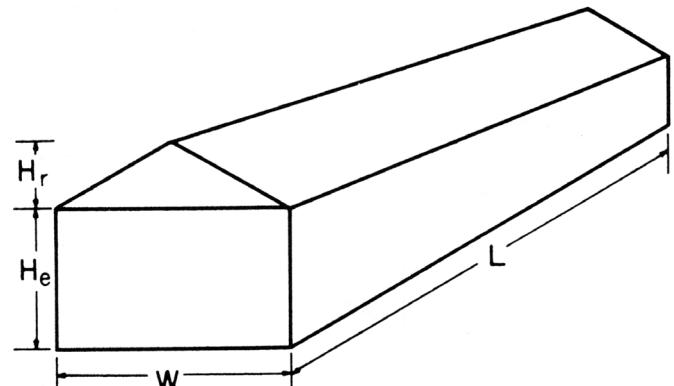

- L = length
- W = width
- W_1 = width of short span
- W_2 = width of long span
- H_e = height from floor to eave
- H_r = height from eave to top

$$\text{Greenhouse volume in cubic feet} = [(H_e \times W) + (W_1 \times H_r)/2 + (W_2 \times H_r)/2] \times L$$

Figure 1-B. Formula for calculating even-span greenhouse volume.

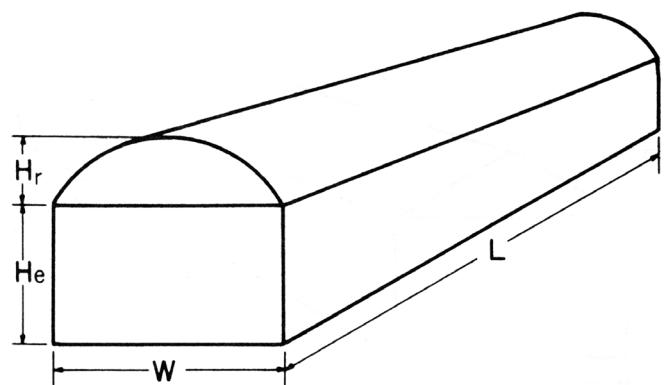

- L = length
- W = width
- H_e = height from floor to eave
- H_r = height from eave to top

$$\text{Greenhouse volume in cubic feet} = [(H_e \times W) + (W \times H_r)/2] \times L$$

Figure 1-C. Formula for calculating quonset greenhouse volume.

- L = length
- W = width
- H_e = height from floor to eave
- H_r = height from eave to top

Formula for calculating the surface area of the gable end, which is an arc segment.

A = arc length of the roof

R = radius of circle of which a is the arc segment

α = the angle forming the arc segment

$R = c$

$c = b + H_r$

$a^2 + b^2 = c^2$

$\tan A = a/b$

Examples: $H_r = 4$ ft, $W = 20$ ft

$R = c$

$c = b + 4$

$a = 10$ ft

$(10)^2 + b^2 = (b + 4)^2$

$b = 10.5$

$c = 10.5 + 4 = 14.5 = R$

$A = (\pi \times R \times \alpha)/180^\circ$

$\tan A = 10/10.5$

$\tan A = 0.9524$

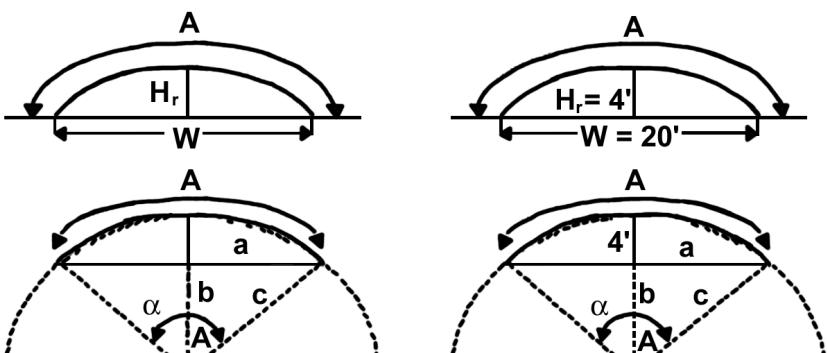

$\arctan 0.9524 = 43.6^\circ$

$\alpha = 2 \times A = 2 \times 43.6^\circ = 87.2^\circ$

$A = (\pi \times R \times \alpha)/180$

$A = (3.14159 \times 14.5 \times 887.2)/180$

$A = 22$ ft 6 in.

$$\text{Area of an arc segment} = (A \times R)/2$$

$$\text{Area} = (22.6 \times 14.5)/2 = 164 \text{ ft}^2$$

But we do not need the area of the entire arc segment, only the area actually present on the greenhouse; so we need to SUBTRACT OFF the bottom triangles:

$$\text{Area of a triangle} = 1/2 (\text{width} \times \text{height}) = a \times b = 10 \times 10.5 = 105 \text{ ft}^2$$

$$\text{So the area of one gable end} = 164 \text{ ft}^2 - 105 \text{ ft}^2 = 59 \text{ ft}^2$$

Volume (above eaves) is area of gable multiplied by the length of the greenhouse.
Greenhouse volume in cubic feet = $(H_e \times W \times L) + (\text{Volume above eaves})$.

Formulas for calculating variously shaped areas

These formulas are helpful in determining application rates for areas with specific shapes. Knowledge of the areas is also helpful in estimating amounts of various soil amendments and number of plants needed.

Figure 2-A. Square or rectangle

Area = Length x Width

Area = $L \times W$

Area = $(50 \text{ ft}) \times (50 \text{ ft})$

Area = 2,500 sq ft

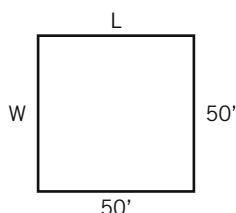

Figure 2-B. Triangle

Area = $1/2 \times \text{Base} \times \text{Height}$

Area = $1/2 \times B \times H$

Area = $1/2 \times (50 \text{ ft}) \times (75 \text{ ft})$

Area = 1,875 sq ft

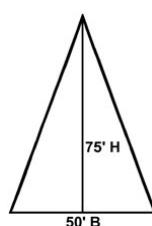

Figure 2-C. Circle

$$\text{Area} = \pi \times \text{Radius} \times \text{Radius}$$

$$\text{Area} = \pi \times R^2 = 22/7 (3.14)$$

$$\text{Area} = 3.14 \times 20 \text{ ft} \times 20 \text{ ft}$$

$$\text{Area} = 1,256 \text{ sq ft}$$

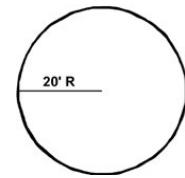

Figure 2-D. Circle (within 5% accuracy)

$$\text{Area} = \text{Diameter} \times \text{Diameter} \times 0.8$$

$$\text{Area} = 0.8 \times D^2$$

$$\text{Area} = 0.8 \times 40 \text{ ft} \times 40 \text{ ft}$$

$$\text{Area} = 1,280 \text{ sq ft}$$

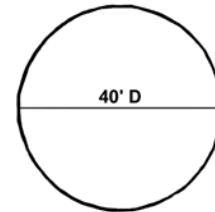

Figure 2-E. Ovals or egg-shaped (within 5% accuracy)

$$\text{Area} = \text{Length} \times \text{Width at midpoint} \times 0.8$$

$$\text{Area} = 0.8 \times LW$$

$$\text{Area} = 0.8 \times 20 \text{ ft} \times 50 \text{ ft}$$

$$\text{Area} = 800 \text{ sq ft}$$

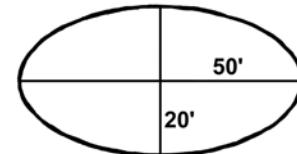

Figure 2-F. Irregular shapes (within 5% accuracy)

- Measure the longest axis of the area (length line).
- At every 10 ft on the length line, measure the width at right angles to the length line.
- Total all widths and multiply by 10.

$$\text{Area} = (A + B + C + D + E + F) \times 10$$

$$\text{Area} = (50 \text{ ft} + 75 \text{ ft} + 125 \text{ ft} + 150 \text{ ft} + 75 \text{ ft} + 25 \text{ ft}) \times 10$$

$$\text{Area} = 500 \times 10$$

$$\text{Area} = 5,000 \text{ sq ft}$$

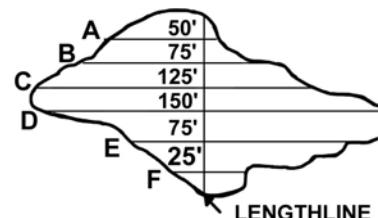

Figure 2-G. Unusual-shaped areas

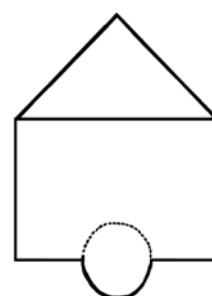

Calculation should be made for various sections. In this case, calculate and add together:

Area of triangle

Area of rectangle

$\frac{1}{2}$ Area of circle

Total area = total sq ft of area
